## AUTHORS of ARTICLES, REVIEWS, COMMUNICATIONS, and ABSTRACTS

## Editor's Note

This section of the *General Index* lists by individual author the page numbers from all four quarterly issues of:

## Articles (A)

## Book Reviews (R)

## Abstracts (S)

## Review Articles (RA)

## Communications (C)

Following this section is an *Index of Authors of New Books*, which lists by author the classification numbers and *JEL* numbers of books appearing in the *Annotated Listing of New Books* section of the four quarterly issues. Articles without abstracts are not listed in the cumulative *General Index*. These articles may be found by referring to the *Index of Authors of Articles in the Subject Index*, which appears in each issue.

# Index of Authors of New Books

This *Index* lists the authors of the books in the March, June, September, and December *Annotated Listing of New Books* by author, alphabetically, with their subject classifications (primary subject first), and "JEL numbers." (Note: "R.D." stands for "Related Disciplines.") If a book has more than one author each name (up to three) is listed separately. Annotations are numbered consecutively by JEL number in the *Annotated Listing* section of each issue, as follows: March 87-0001 to 87-0339, June 87-0340 to 87-0641, September 87-0642 to 87-0969, and December 87-0970 to 87-1257.

# Growth and Slowdown in Advanced Capitalist Economies: Techniques of Quantitative Assessment

By ANGUS MADDISON  
University of Groningen

*I am indebted to Moses Abramovitz for advice and encouragement; to comments made at a seminar of the Centraal Planbureau, The Hague; to Edward F. Denison, Aerd Houben, John Kendrick, John Martin, Robin Matthews, Jan Pen, John Pencavel, Peter Sturm, and anonymous referees for discussion and critical comment; and to Derek Blades, Roland Granter, and Micheline Harary for help with statistical source material.*

SINCE 1973, economic growth in Western countries has slowed in terms of all relevant measuring rods. The phenomenon has been strikingly general, persistent, and large. Average GDP growth for the major European economies and Japan fell from 5.6 percent in 1950-73 to 2.1 percent thereafter, and for the U.S. from 3.7 to 2.3 percent.

Because the growth process since 1973 was interrupted by important recessions in 1974-75 and 1980-81, by acceleration of inflation, by two oil shocks, and by the collapse of the Bretton Woods payments system, significant conjunctural elements have clearly played a role in the slowdown. Present high levels of European unemployment are an indicator that output is below potential. It is also obvious, however, (see Tables 1 and 2) that the postwar golden age, which ended in 1973, was exceptional. If it were blotted from memory, performance

since 1973 would appear less worrisome.

Table 2, on labor productivity, suggests quite strongly that there has not been a simple reversion to historic norms. In Europe and Japan, productivity since 1973 has grown much faster than in the eight decades from 1870 to 1950. By contrast, U.S. productivity growth has fallen well below what was a much more stable long-term norm. The postwar process of convergence by the five follower countries has not been halted since 1973, and the productivity gap with the U.S. (see Table 3) is now smaller than ever. There is no evidence here for the notion of Eurosclerosis, which alleges that Europe's technical dynamism lags behind that of the U.S. One can also see that the Japanese growth advantage over Europe is much smaller than it was in the golden age.

This paper attempts to throw light on the causes of growth acceleration and de-

TABLE 1  
PHASES OF GDP GROWTH, 1870-1984  
(average annual compound growth rates)

	I 1870-1913	II 1913-50	III 1950-73	IV 1973-84	Acceleration from Phase II to Phase III	Slowdown from Phase III to Phase IV
France	1.7	1.1	5.1	2.2	+4.0	-2.9
Germany	2.8	1.3	5.9	1.7	+4.6	-4.2
Japan	2.5	2.2	9.4	3.8	+7.2	-5.6
Netherlands	2.1	2.4	4.7	1.6	+2.3	-3.1
U.K.	1.9	1.3	3.0	1.1	+1.7	-1.9
Five country average	2.2	1.7	5.6	2.1	+4.0	-3.5
U.S.	4.2	2.8	3.7	2.3	+0.9	-1.4

celeration since 1913 using a simple set of comparative growth accounts for the five biggest and the largest of the smaller capitalist economies. It also reviews the methodology used in 15 other similar studies. For the postwar period these are the pioneer work of Edward Denison (1967) on nine countries, Denison and William Chung (1976) on Japan and the U.S., Laurits Christensen, Dianne Cummings, and Dale Jorgenson (1980) on nine countries, John Kendrick (1981) on seven countries, and John Helliwell, Pe-

ter Sturm, and Gérard Salou (1985) on seven countries. None of these has the long perspective we seek here. Fortunately for four of our six countries, there are historical studies in this vein: Kendrick (1961, 1973) on the U.S., J-J. Carré, P. Dubois, and Edmond Malinvaud (1972) on France, Kazushi Ohkawa and Henry Rosovsky (1973) on Japan, and Robin Matthews, Charles Feinstein, and John Odling-Smee (1982) on the U.K. In addition, there are the four successive studies Denison (1962, 1974, 1979, 1985)

TABLE 2  
PHASES OF GROWTH IN LABOR PRODUCTIVITY (GDP PER HOUR WORKED), 1870-1984  
(average annual compound growth rates)

	I 1870-1913	II 1913-50	II 1950-73	IV 1973-84	Acceleration from Phase II to Phase III	Slowdown from Phase III to Phase IV
France	1.7	2.0	5.1	3.4	+3.1	-1.7
Germany	1.9	1.0	6.0	3.0	+5.0	-3.0
Japan	1.8	1.7	7.7	3.2	+6.0	-4.5

has made for U.S. growth back to 1929, and the Frank Collop and Dale Jorgenson (1980) study on U.S. performance since 1947.

The works reviewed here raise most of the methodological issues in growth accounting, but we do not aspire to cover the intellectual origins of this approach in full. References to the antecedent literature can be found in Maddison (1972) and in Christensen, Cummings, and Jorgenson (1980).

The present survey is confined to six advanced capitalist countries because for these countries it was possible to check hypotheses quantitatively against historical experience; however, it is desirable to extend the coverage of comparative studies to countries lower down the scale of per capita income and productivity in order to throw more light on the nature of the convergence process and on the "opportunities" or disadvantages of initial backwardness. There are, in fact, some interesting country studies of this kind: Bakul Dholakia (1975) on India, Kwang-Suk Kim and Joon-Kyung Park (1985) on Korea, and Carlos Langoni (1974) on Brazil.

Growth accounting of this type can not provide a full causal story. It deals with "proximate" rather than "ultimate" causality and registers the facts about growth components; it does not explain the ele-

ments of policy or circumstance, national or international, that underlie them, but it does identify which facts need more ultimate explanation. This kind of exercise forces one to merge and match data in a way that provides valuable cross-checks on the consistency and plausibility of the basic growth indicators both for individual countries and across countries. It is particularly useful in avoiding or identifying double counting and in tracking down the complex interactions among causal components.

The comparative approach is of great value in this field. Hypotheses, estimating techniques, and weights that "explain" performance reasonably well in a single country need to be tested in other countries where they may well "overexplain" growth experience.

This technique of diagnosis is most valuable when it is transparent. Transparency is in fact this technique's major charm, for although on significant points there are large judgmental elements, these are not so easily forgotten as they may be in econometric analysis. If all the steps are identified and the statistical appendix provides the basic series, the reader has building bricks for alternate hypotheses. There are no iron laws. The practitioner can augment, truncate, and reshuffle to taste, provided that the "explanations" of growth are logical, consis-

tent, and transparent. This is why the present paper sticks to simple, standardized, and rather conservative hypotheses throughout, so that the impact of a change in assumptions for a particular growth component can be readily traced on a cross-country basis.

Growth accounts can be organized in several ways to serve different purposes. In Denison (1967) the main objective was to explore why growth rates differed among countries. The analysis was concentrated on the period 1950–62, and the accounting covered differences in *level* of performance as well as growth rates.

In the most general form of the accounts, the main item around which the detailed explication is built is total output (which can be measured in different ways, as can be seen below), but if one wants to abstract from differences in demography, activity rates, and working hours, the same basic material can be recast as productivity accounts, where labor productivity is the central point. This approach can be used to give more emphasis to problems of technical progress.

For medium-term conjunctural analysis one can complement the “actual” accounts with an alternative set of counterfactual “potential output” accounts. The confrontation of the two can help identify the losses from macropolicy mistakes or external shocks, as in 1973–84.

Over longer periods, the accounts can be recast as measures of growth acceleration or slowdown, and in this form can help identify the distinctive features of growth momentum in the different phases of development.

This latter approach is used here, as one of our interests is in diagnosing the major changes in momentum, which have been a feature of twentieth-century capitalist development. The timing of these changes has been very similar in all the countries considered here, and the generality of the acceleration/slow-

down phenomena is very striking. This can be seen very clearly in Table 21 where only 15 of the 90 growth components were negative in the acceleration phase, and in Table 22 where only 8 of the 90 components were positive in the slowdown phase.

The second main feature of the present analysis is a concern with the nature of the convergence process, in which the follower countries have been catching up with the leader, the U.S. This process has lasted now for four decades, and its nature is important not only for these countries but for countries at much lower levels of productivity and per capita real income.

To study convergence problems fully, the accounts should show levels of performance as well as growth rates. This aspect is not developed extensively here, but levels of real output and productivity are shown corrected for differences in purchasing power of currencies, and Table 13 shows rough estimates of this kind for levels of capital stock and some other relevant magnitudes.

The present estimates cover the period 1913–84, dividing it into three major phases: 1913–50, 1950–73, and 1973–84. Each of the phases in this periodization shows distinctly different features. The use of 1973 as a turning point is hardly controversial. Most observers of the slowdown phenomenon use it, for example, Denison (1985), Federal Reserve Bank of Boston (1980), Shlomo Maital and Noah Meltz (1980), Kendrick (1981, 1984), Assar Lindbeck (1983), Henning Klodt (1984), and William Baumol and Kenneth McLennan (1985). The year 1950 was chosen as the beginning of the postwar period, because it was a year in which reconstruction was reasonably complete; however, in the case of Germany and Japan there was still substantial underuse of labor and capital for which allowance has to be made. Some readers

may therefore wish to compare 1973–84 with a shorter part of the golden age, say 1960–73. The period 1913–50 has its unity only as a time of troubles including two world wars and the Great Depression, so one could arguably try to break it down into smaller units. It is regrettable that the 1870–1913 period cannot yet be put into this framework because of gaps in the capital stock estimates and in the disaggregation of GDP by sector. Space did not permit presentation of annual estimates, but for several key magnitudes they can be found in Maddison (1982).

### *I. Labor Productivity*

The oldest index of productivity growth is that for labor productivity,  $\dot{\Pi}^1$ , defined as the difference between the compound rate of increase in output,  $\dot{O}$ , and the rate of increase in labor input,  $\dot{L}$ :

$$\dot{\Pi}^1 = \dot{O} - \dot{L}.$$

This indicator has considerable attractions in an economy where labor productivity growth is stable in the long term and where a major social concern is with the level of employment. It is a better measure of long-term technical “progress” or welfare than GDP, which is affected by differences in demographic dynamism, or GDP per head of population, which takes no account of working hours per person, which have declined by almost half over the past century, or of employment rates.

There are two statistical prerequisites for this ratio—measures of output and labor input.

#### *A. The Output Measure*

Growth accountancy is indebted to pioneers like Colin Clark, Richard Stone, and Simon Kuznets who developed the conceptual framework of national ac-

counts, to scholars who have made historical estimates, to governments who have made official estimates for the postwar period, and to OECD for publishing these official estimates in comparable form. As productivity analysis involves comparisons of levels as well as growth, we are also indebted to those (mainly Milton Gilbert and Irving Kravis) who developed techniques for correcting exchange rate comparisons for purchasing power parities, and the OECD, which now publishes such estimates on an annual basis. The most easily available aggregate for comparative purposes is gross domestic product (GDP), which reflects the whole spectrum of domestic production. This is what I have used here, and this is also true of Matthews, Feinstein, and Odling-Smee (1982) and Carré, Du-bois, and Malinvaud (1976). Denison (1967) used net national product (which includes income from abroad), and he and Kendrick (1961) showed both private and total versions of this latter measure as did Denison and Chung (1976). Oh-kawa and Rosovsky (1973) analyzed agricultural and private nonagricultural products separately.

In most sectors of the economy, output is produced by both labor and capital, but the housing and government sectors are rather special. The income flow from housing is virtually all a return on capital and very little labor is involved. Conversely, with government activity, as conventionally measured, virtually all the income flow is from labor. Although governments own substantial capital assets, there is generally little operating profit on these, and even depreciation may be significantly understated. For these reasons, and also because of the limited character of market pricing here, the housing and government sectors are often excluded from growth accounts.

The choice of one national accounting aggregate rather than another should not

Source: This table shows different measures of aggregate product as a percentage of GDP at factor cost averaged over the years 1973-82. Thus French GNP at market prices was 14.7 percent higher than French GDP at factor cost. First nine columns derived from OECD(d). Last column from Christensen, Cummings, and Jorgenson (1990).

be a significant matter of controversy as long as the aggregate used is the same for all the countries in the comparison, but there is a considerable difference in the level of the different aggregates, which must be kept in mind in comparing results of different authors. The first nine columns of Table 4 show different aggregates derivable on a consistent basis from the OECD national accounts, which might all be candidates for growth-accounting purposes. This paper uses estimates based on the column 3 concept. Kendrick (1981) uses a column 5 aggregate and Denison (1967) a column 7 aggregate. In fact the growth movements for all the first nine aggregates are remarkably similar. In practice the main impact of using different aggregates arises when they are used as a denominator for the factor weights.

The last column of Table 4 shows the aggregate used by Christensen, Cummings, and Jorgenson (1980), who exclude government but augment GDP to impute a service flow from consumer durables and who use price conventions that represent neither factor cost nor market prices but depend on their assessment of the incidence of taxes. Indirect taxes "unrelated to factor outlay" are excluded, but some others such as property taxes are included. While the variation between the first nine columns of Table 4 is fairly systematic across countries, this is not true of column 10 where the French aggregate is 9 percent higher than GDP at factor cost and the Netherlands aggregate is 5 percent below.

Table 4 is not an exhaustive listing. Helliwell, Sturm, and Salou (1985) adjust GDP to include the impact of net changes in energy imports because they treat energy as a factor of production. In an exploratory study, Kendrick (1976) took a particularly broad view of capital formation and total output. He augmented 1969 U.S. GNP by 34 percent

by imputing rentals on consumer durables, inventories, government capital, and intangibles such as R and D and earnings foregone by students, none of which are included in the conventional national accounts.

## B. Labor Input

Construction of labor productivity involves the merger of several sources of data on employment, weekly working hours, and time off for holidays, sickness, strikes, etc., to arrive at total labor input (see Tables A-10 and A-11 and Maddison 1980a on the items required to measure hours).

## II. Capital Productivity

The next major step in productivity analysis came with the development of capital stock measures using the perpetual inventory method developed by Raymond Goldsmith for cumulating successive increments of capital stock. A prerequisite for such capital stock measures is historical estimates of investment and reasonable price deflators, so estimates of this kind did not begin to appear in a form suitable for cross-country comparison until the 1960s, and even now only three of our six countries (Germany, the U.K., and U.S.) publish official comprehensive estimates of this kind. These measures represent a great step forward for growth analysts compared with the investment to incremental output ratio (ICOR) which was in use in the 1950s.

The capital (K) productivity index

$$\dot{Y}/\dot{K} = \dot{O} - \dot{K}$$

produces quite different results from that for labor. Labor productivity seldom declines even on an annual basis, and in the long run is always positive whereas capital productivity is only mildly positive and can be substantially negative in depressed business conditions, such as

those since 1973 (see Table 5). The close correlation between capital and output movements over the long run is the reason simple regressions find capital such a powerful explanation of growth.

Over the long term the gross capital stock (i.e., cumulated gross investment minus scrapping) and net capital stock (i.e., cumulated gross investment minus depreciation) indexes tend to move in a similar way (though the level of the net stock is of course smaller), but when capital formation is accelerating, as in 1950-73, the net stock grows faster than the gross, and, when capital growth slows down, as in 1973-84, the gross stock grows faster than the net (see Raymond Goldsmith 1962 and Michael Ward 1976 for the algebra and Tables A-15 to A-18 below for the figures).

The movement in gross capital stock gives a somewhat exaggerated representation of changes in capital's ability to contribute to production. An automobile is counted at its purchase value in the gross stock until it is scrapped. The car will indeed perform its physical function to the end but its reliability will decline and it will need increasing maintenance. By contrast, the net stock represents the discounted value of the car to its owner, but the declining second-hand value

overstates the decline in functional attributes. The car's contribution to current production is much closer to the gross than the net valuation. I have therefore used the gross stock to measure capital input, but figures on net stock movements are given in the statistical appendix (Tables A-15 to A-18).

Denison (1967) takes a simple average of gross and net stock. Kendrick (1961, 1973) and Matthews, Feinstein, and Odling-Smee (1982) show both concepts separately; Ohkawa and Rosovsky use gross stock, Carré, Dubois, and Malinvaud net stock.

In some growth-accounting exercises, for example, in three of the historical country monographs, the individual items in the capital stock are weighted at their asset values, and it is assumed that the stock thus calculated provides a proxy measure of the potential service flow derivable from the assets; however, the service flow is better approximated by using rental rather than asset weights, particularly when the structure of the gross capital stock is changing between assets with different service lives. There has in fact been a long-term increase in the share of shorter-lived assets (compare the growth of structures and equipment in Table A-17), and this means that the growth in the potential service flow has been bigger than the growth of the gross stock at asset values. The point is clear if one considers two assets such as a house and a car. A \$100,000 house has an asset value ten times as big as a \$10,000 car, but the annual rental value of the house might well be as low as 5 percent whereas for the car it might be 30 percent (as the annual car rental must cover a much bigger element of depreciation than in the case of the house). Thus the rental weights would be in the ratio of 5:3 compared with 10:1 for the asset ratio.

In Table 5, on capital productivity

growth ( $\dot{I}^2$ ), asset weights were used for capital, but in measuring  $\dot{I}^3$ ,  $\dot{I}^4$ , and  $\dot{I}^5$  below, I used what amounts to rental weights for the two major categories, residential and nonresidential capital, and the average difference between the "capital quantity" thus measured and the growth of the two types of capital amalgamated at asset weights (Table A-15) is 0.2 percent a year for the six countries. However, we could not use rental weights systematically for different kinds of nonresidential assets because no breakdown was available for some of the countries. In this respect, the growth of "capital quantity" is understated here.

Kendrick (1961) was the first analyst to show figures at both net asset and net rental weights. He called the first magnitude the "capital stock" and the second "capital input." For the 68-year period from 1889 to 1957 his figures for the "national economy" show U.S. capital stock increasing at a compound rate of 2.54 per annum whereas his "capital input" grew somewhat faster, at 2.74 per annum (see pp. 320-22 and 328-31). Kendrick did not use rentals by asset type but by industry of use; otherwise the difference between the two concepts might well have been larger. It would certainly be larger if he had used gross weights because these include depreciation provisions that vary much more between assets than the net return.

Christensen, Cummings, and Jorgenson (1980) also draw attention to the difference between asset and rental weights, and the difference between the two is a good deal larger in their study than in Kendrick (1961). Their average capital stock growth rate for the six countries is 5.1 percent per annum (see Table 6) and their capital input grows at 6.2 percent. There are two main reasons why their differential is bigger than Kendrick's. First, they use gross weights; second, they include consumer durables

TABLE 6

Source: Christensen, Cummings, and Jorgenson (1980, pp. 654-80). These were compiled separately for seven asset classes for the private sector, that is, consumer durables, producer durables, residential structures, non-residential structures, land, farm inventories, and non-farm inventories. Each of the seven classes is broken down by four ownership sectors, with adjustment for their different tax burdens, that is, corporate business, noncorporate business, households and nonprofit institutions (see pp. 619-22); so there are 28 categories of capital in their accounts. Figures in parentheses for the U.S. are from Gollop and Jorgenson (1980, p. 87). Here there are six asset classes, as farm and nonfarm inventories are merged, and three ownership sectors as households and nonprofit institutions are merged. However, the stocks are disaggregated into 915 categories in 1952-73. <sup>a</sup> 1952-73. <sup>b</sup> 1951

that have relations are further of a price conversion of national accounts at different levels of aggregation. In synthetic Gollop and Jorgenson (1980) figures for the U.S. in Table 6, the even wider spread between the two concepts is perhaps due to the use in that study of an extra rapid (double declining balance) replacement pattern.

With the exception of Dutch residential capital and French residential capital from 1966 onward, all the capital stock estimates presented in this paper were derived by the perpetual inventory technique and are more comparable than those Denison had to use for some coun-

tries in 1967. There are still differences in assumptions between countries in asset lives, scrapping patterns, depreciation formulas, techniques of price deflation, and years used as benchmarks for weighting purposes (see Maddison 1982, pp. 214–32, for a more detailed analysis of the significance of these variations). Differences in growth of capital stock between countries should therefore be taken only as rough orders of magnitude, and improvement of the historical capital stock estimates is obviously a major priority for better comparative growth analysis.

### III. Joint Factor Productivity

Once the capital stock is available the next step in growth accounting is an index of joint factor productivity,  $\dot{Y}^3$ , constructed by weighting together the contribution of labor and capital:

$$\dot{Y}^3 = \dot{O} - a\dot{L} - (1 - a)\dot{K}.$$

The first comparative approach of this kind was made by Jan Tinbergen in 1942 with crude estimates for 1870–1914 for France, Germany, the U.K., and the U.S. He gave capital a weight of 0.25 and labor 0.75 using Paul Douglas' earlier results from production functions where the two weights were constrained to add to 1 (see Douglas 1948).

The first comprehensive modern study in this field was Kendrick (1961). Kendrick and the authors of all the subsequent historical country monographs have used factor shares in GDP (or in whatever aggregate they used to measure output) as labor and capital weights for their joint factor productivity measures, on the grounds that in neoclassical distribution theory these represent rewards proportional to the contribution of labor and capital to production.

One has only to look at the empirical basis from which the weights are derived

to see that the neoclassical assumptions are very crude. Table 7 gives a breakdown of average income shares of GDP at factor cost for the six countries taken from the OECD(d) for 1973–82.

The first item is rents for dwellings, including depreciation. In all the countries, there are various kinds of rent control and subsidies either to tenants or proprietors that change over time and make the market imperfect. Even without these, this is a sector with fairly long-term private contracts that react with long lags to changes in inflation, mortgage rates, and so on. Finally, one should note that a large part (often more than half) of these incomes has to be imputed, because the houses are occupied by their owners.

The second item of capital income is depreciation that is derived by national income statisticians using guidelines drawn partly from direct estimates of asset lives and partly from the legal provisions for tax relief. These estimates are therefore very crude.

The third item of capital income is the operating surplus on nonresidential capital. This has to be calculated after elimination of the labor component of incomes of self-employed persons, whose incomes are mixed and are included with the operating surplus in the national accounts. The estimates of the labor income of the self-employed in Table 7 were based on the common assumption that their per capita labor compensation was the same as the average for wage and salary earners.

Government-owned assets form a substantial part of the capital stock figures we have used. In 1984, the government share of nonresidential fixed assets (general government and government enterprises combined) was 30 percent in Germany, 38 percent in Japan, 22 percent in the Netherlands, 42 percent in the U.K., and 30 percent in the U.S. How-

ever, no income is imputed in the national accounts (column 3 of Table 7) for general government assets such as roads, schools, or public buildings. Income from government enterprises, which is included, is often depressed by a tendency to underprice their output.

The fourth column of Table 7 is the sum of the first three columns, and represents the total capital share.

The labor share has three components: the imputed labor incomes of the self-employed; wages and salaries; and employer contributions to social security, private pensions, and welfare. The latter are only

very partially developed, and are not increasing, and it should be remembered that wages and salaries are also affected by government regulation and by requirements that they include payment for holidays.

Table 7 shows a total capital weight for 1973-82 which averages 28.6 with a dispersion around the average that is not too big. The capital share was somewhat depressed in this period. We were not able to make a comparable estimate for 1950-73 as a whole, but the figure for 1960-73 was about 32 percent.

Table 8 shows the weights used in

<sup>a</sup> 1952-62; <sup>b</sup> 1967-82; <sup>c</sup> 1952-73; <sup>d</sup> 1951-73; <sup>e</sup> 1955-73.

some other comparative studies. Denison's weights are the lowest because he measures output net of depreciation; Christensen, Cummings, and Jorgenson (1980) have the highest weight because they augment capital to include consumer durables. Helliwell, Sturm, and Salou (1985) also have augmented weights, and Kendrick (1981) has high weights because he excludes government (which has little capital income relative to its share of product).

For earlier years, the four country monographs (see Table 9) show an average weight for capital over the whole period they cover of 34 percent, with a distinct tendency for the weight of capital to fall over time.

The change in weights over time partially reflects underlying real forces such as the change in factor prices, which provides a legitimate reason for using differ-

ent weights for different periods; however, given the crudeness of the statistics, the possible distortion involved because of the large decline in the relative importance of income from self-employment, the increasing legislative squeeze on property shares, and the rising share of government-owned assets, on which rental income is very small, it seemed wise to use the same capital weight for all our periods and countries.

Because GDP is our measure of output, and capital stock is on a gross basis, gross weights are the most appropriate for our purpose. We have therefore given capital a weight of 30 percent in total, with 7 percent for residential capital and 23 percent for other forms. This is a little higher than the figures for 1973-82 in Table 7, but the capital share was depressed somewhat in that period.

We did not include land and invento-

TABLE 9

France	Gross weights, 28 percent throughout (Carré, Dubois, and Malinvaud 1972, p. 246)
Japan	Gross weights, 40 percent for 1913-38, 31 percent for 1954-64 for private nonagricultural output (Ohkawa and Rosovsky 1973, pp. 316-17)
U.K.	Gross weights, 41 percent for 1856-73, 43 percent for 1873-1913, 33 percent for 1913-51, 27 percent for 1951-73 (Matthews, Feinstein, and Odling-Smee 1982, p. 208)
U.S.	Net weights, 35 percent for 1899-1919, 25 percent for 1919-53 for the national economy (Kendrick 1961, p. 85). The revised figure for 1929-53 in (Kendrick 1973, p. 173) averaged 29 percent.

ries in the capital estimates for lack of data.

#### IV. Augmentation of Factor Inputs

Although the total factor productivity approach was a big leap forward in growth analysis, it was clear that a good deal remained unexplained. Kendrick (1961) accounted for less than half of U.S. growth in the period 1869-1957, and subsequent investigators have therefore tried to reduce the size of the productivity component by "augmenting" estimates of factor input. Where  $K^*$  is "augmented" capital, and  $L^*$  is "augmented" labor, the formula became:

$$\dot{Y}^* = \dot{Q} - a\dot{L}^* - (1 - a)\dot{K}^*.$$

##### A. Augmenting Labor Input

Kendrick had already distinguished between the growth of working hours and the growth of "labor input," because he weighted working hours in different industries by their relative average earnings. This "augmented" labor input very little, but under the influence of Theodore Schultz (1961), Denison in his first study for the U.S. (1962) quickly incorporated a sizable adjustment for improvement in educational quality. He also made adjustments for changes in the age-sex composition of employment. Both of these practices have now become general in multifactor growth analysis, though

the old partial measure of labor productivity is almost never expressed with the new augmented denominator.

Virtually all subsequent analysts have taken over the age-sex and education adjustments in one form or other. Here we made no age adjustment because age figures and age-earnings differentials were not reliable for the 1913-50 period. A 0.6 weight was applied to female employment. For education it is generally accepted that some of the wage differential by level of education represents rewards for intelligence, family connections, or the impact of credentials on the public sector. Some compensation for some weights is warranted for education level. 12. In moving of educational compressed differential broadly similar to Denison (1962). See Maddison (1976) for a discussion of the complex role of education, and see George Psacharopoulos (1984) for a discussion of various techniques of measurement.

A more controversial innovation by Denison (1962) was his assumption that there is a compensatory increase in work intensity that partially offsets declines in working hours. Denison assumed that above 2,529 hours a year, reductions in work time are fully compensated for by increased work intensity, and that below

1,762 hours there is no compensating offset. In between, there was a varying and partial offset. In later studies, Denison refined this assumption for different categories of worker.

This large quality effect seems questionable over the long term. In the short term, a cut in working hours with no corresponding wage reduction may stimulate worker effort and managerial efficiency. But these effects wear off as the memory of the old situation fades. Compared with their grandparents, people now have long holidays, two-day weekends, shorter weekly hours, easy facilities for sickness absence, greater security of employment, more human relations with foremen and supervisors. Their work is less fatiguing, but a lot of the extra reserve of energy goes into leisure pursuits like jogging, skiing, and wind surfing rather than in work effort. I have therefore simply assumed that cuts in working hours lead to an equiproportionate cut in labor input.

Matthews, Feinstein, and Odling-Smee (1982, p. 104) have followed Denison's lead in assuming a work intensity effect; Ohkawa and Rosovsky (1973) ignore it, and Carré, Dubois, and Malinvaud (1972, p. 95) acknowledge that it may play a role, but do not measure it. It is ignored by Kendrick (1981), by Christensen, Cummings, and Jorgensen (1980), and by Helliwell, Sturm, and Salou (1985).

### **B. Augmenting Capital Input**

In 1962 Robert Solow suggested incorporation of a hypothetical quality improvement in successive vintages of capital on the grounds that physical investment is the prime vehicle by which technical progress is realized. He overstated the case in assuming, by way of illustration, "that new technology could be introduced into the production process *only* through gross investment in new plant and equipment" (Solow 1962,

p. 76). Later (1963, p. 80), he suggested that plausible rates of quality augmentation for Germany and the U.S. were on the order of 4 or 5 percent a year, which he derived by assuming all progress to be embodied, using a production function where there was no quality improvement for labor, and no "disembodied" technological progress.

Denison rightly rejected the catchall version of the embodiment approach and argued that the high-quality improvement factor was incompatible with what we know about the lives of assets, which would be scrapped earlier than they are if Solow's extreme assumptions were correct.

It is quite clear that some of the impact of technical progress is disembodied and arises from improvement in the content of knowledge acquired by employees and managers in school and on the job, and by retrofitting and recombining old capital assets; however, insertion of a modest element of embodied technical progress in the analysis does illuminate the nature of the growth process and clarifies the impact of changes in the age of capital in a way that is not possible outside the vintage context.

In rejecting Solow's suggestions, Denison (1967, pp. 144-50) argued as if the only legitimate element of the embodiment effect arose in cases where the average age distribution of the capital stock changes (and even this in a very narrow sense, i.e., abstracting from the impact of changes in the distribution of capital between structures and equipment). He assumed that embodied technical progress makes its impact only by changes in age structure and rate of quality improvement, which alter the ratio between average and best practice at different dates, though the embodiment thesis is also (and mainly) concerned with improvements in average practice over time (see Maddison 1972 for a more detailed discussion of the issue).

TABLE 10  
AVERAGE AGE OF THE GROSS NONRESIDENTIAL FIXED CAPITAL STOCK, 1950-84

	1950	1973	1984
France	15.14	9.98	12.01
Germany	16.21	9.72	13.10
Japan	12.48	8.13	10.45
Netherlands	14.71	10.25	13.37
U.K.	13.18	10.93	12.98
U.S.	13.37	11.70	12.50

*Source.* These estimates assume that all assets have the same 30-year life in all the countries and that the retirement pattern is rectangular, that is, all assets are scrapped on their thirtieth birthday. Annual increments to the stock were calculated by applying the ratio of domestic nonresidential fixed investment to GDP to the index of real GDP (1950 = 100) at constant prices. These increments (all measured as fractions of 1950 GDP) were cumulated over 30 years with adjustment for war damage. Thus the 1950 stock is the sum of the increments from mid-1920 to mid-1950, the 1973 stock the sum of mid-1943 to mid-1973 increments, and the 1984 stock, the sum of the increments from mid-1954 to mid-1984. Because one knows the size and age of all the increments, the average age can be easily calculated. See Maddison (1972, Appendix A) for an illustration of the method used. War damage was derived from Maddison (1976, p. 472) for France (8 percent of the pre-1946 asset formation), Germany (13 percent), and the U.K. (3 percent), from Maddison and Bote Wilpstra (1982, p. 82) for the Netherlands (15 percent), and from Bank of Japan (1966, p. 27) for Japan (25.7 percent). The GDP estimates were from sources cited in Table A-1. Investment coefficients for postwar years are generally from OECD(d), and for earlier years in France from Carré, Dubois, and Malinvaud (1972, p. 652) reduced by 25 percent to eliminate housing and the repairs component of nonresidential construction (1920-21 and 1939-46 investment rates were my estimates), Germany from Wolfgang Kirner (1968, pp. 77, 80-81, 92, 104-07); Japan from Ohkawa and Miyoshi Shinohara (1979); Netherlands from Maddison and Wilpstra (1982, pp. 82-84), U.K. from Feinstein (1972), U.S. from Kendrick (1961), Simon Kuznets (1961), Raymond Goldsmith (1955, Vol. I), and for 1929 onward from U.S. Dept. of Commerce publications.

average age of the capital stock did not change.

In all the countries, the average age of the capital stock declined from 1950 to 1973, as the rate of growth of capital stock accelerated a good deal over the previous period. From 1973 to 1984, by contrast, as capital stock growth slowed down, the age of capital rose in all the countries.

Because the weight for capital is 0.3, the contribution of a 1.5 percent capital quality improvement to growth in the standard case (1913-50, where no age adjustment was made) is 0.45 points per annum (see Table 20). The difference between this and the average capital quality contribution (0.55) in 1950-73 for the six countries represents the age effect, that is, an average of about 0.10 for the six countries. These are much smaller than

the age effects in Ohkawa and Rosovsky (1973); Carré, Dubois, and Malinvaud (1972); and Kendrick (1981), but they are similar to the age effect Denison (1967, pp. 304-12) had for Denmark, Germany, and Norway in 1950-55. The main difference between my estimate and the estimates of these authors is that I include the rest of the embodiment effect as well.

It should be noted that the intercountry variation in the capital quality effect cannot be derived directly from Table 10, which shows the average age of the stock, without a vintage effect.

#### V. Assessing the Impact of Supplementary Influences Additional to Augmented Joint Factor Productivity

Some growth analysts stop short after they have measured total factor pro-

TABLE 11a

JOINT FACTOR PRODUCTIVITY, 1913-84  
(annual average compound growth rate)

U.S.	1.19	1.05	-0.27
Average	0.49	2.73	0.50

Source. Derived from Table 20. Augmented joint factor productivity is equal to joint factor productivity minus the contributions of labor quality and capital quality.

activity (see Table 11a or its augmented variant Table 11b). Kendrick (1961) did so because Denison had not then inaugurated the fashion, and Jorgenson, in most of the many studies he has made with various collaborators, has done so out of his strong commitment to neoclassic assumptions. Since Denison's (1962) dazzling tour de force, several other authors, including Kendrick (1981), have followed his example by adding significant supplementary elements. The justification for doing this is clear because the total factor productivity measure, even in its augmented version, still leaves an important amount of growth unexplained, and particularly the growth acceleration of the modern age. This paper therefore incorporates a number of such supplementary influences.

The index for this full-blooded growth accounting approach is:

$$\dot{Y}^5 = \dot{Q} - a\dot{L}^* - (1 - a)\dot{K}^* - \dot{S}$$

where  $\dot{S}$  is the contribution to the rate of growth of a number of supplementary influences. In our case there are nine of these supplementary items.  $\dot{Y}^5$  is perhaps best referred to as the "residual," which is the residue of unmeasured influ-

ences, including disembodied technical progress, statistical and other error. In comparing different specimens of growth accounting, one must remember that the "residual" may be conceptually different for different authors, as is also the case with augmented total factor productivity, and that its comparative significance depends on what is included.

In our approach to use the standard convention across periods, but to include nine supplementary items of long-run character, but some of which are ad hoc and do not apply to all the periods.

The nine supplementary elements (in order of discussion) derive from:

1. changes in economic structure;
2. the process of convergence (catch-up) of follower countries on the leader (the U.S.);
3. foreign trade effects;
4. economies of scale at the national level;
5. the energy price explosion of 1973-84 and induced energy economy;

6. effects of natural resource discovery;
7. costs of government regulation and crime;
8. labor hoarding/dishoarding;
9. use of capacity effects.

The first four are more or less systematic, the next three are ad hoc, and the last two are of a cyclical/conjunctural nature.

For convenience in comparison, these sources of growth, like the factor inputs, are summarized in Tables 19–22 in additive form as contributions to the overall compound growth rate of GDP, rather than shown as indices that would have to be multiplied together to “explain” growth.

#### A. *Structural Change*

Economic growth has been accompanied by massive changes in economic structure whose long-run pattern has been similar in all six countries. As can be seen in Table A-13 there has been a steady decline in the share of agriculture in employment, from an average of 34 percent in 1913 to 5.5 percent in 1984, and an equally steady rise in the share of services from 33 to 62 percent. Industrial development has been different. It accounted for 32 percent of employment in 1913, rose to a peak of 39 percent in 1960, and fell back again to 32 percent in 1984. This same bell-shaped pattern of relative industrialization and deindustrialization has affected all of the countries, though its timing has varied, coming earliest in the Netherlands, U.K., and U.S. and latest in Japan. It is clearly a long-run general tendency, though in the 1973–84 period of depressed demand it was exacerbated by the conjunctural situation.

Structural changes reflect two basic forces that have operated on all the countries as they have reached successively

higher levels of real income and productivity. The first of these is the elasticity of demand for particular products, which has been rather similar at given levels of income (particularly as relative price structures have moved in a similar direction). These demand forces have reduced the share of agricultural products in consumption and have raised the demand for the products of industry and services. The second basic force has been the differential pace of technological advance between sectors. Productivity growth has been slower in services than commodity production: partly because of the intrinsic character of many personal services; partly because of measurement conventions that exclude the possibility of productivity growth in some services. Structural change has also been affected by other influences such as the size of government activity, foreign trade, etc. (see Maddison 1980b).

If productivity were at the same level and grew at the same pace in each sector, there would be no structural effect, but in fact there are big differences. Historically, agriculture has had low productivity levels, and the exodus from low-productivity employment to higher-productivity employment in industry and services was the important element in structural “progress.” After the Second World War, high levels of overall demand speeded up this process, sucking labor out of agriculture at a faster pace. Helped by technical advances, agricultural productivity growth speeded up in the postwar period and has in most cases been faster than that in industry (see Table A-6). Because the relative level of agricultural productivity is a good deal higher now than it was, and employment in agriculture is much smaller, the scope for this kind of sectoral gain has generally eroded. It has not disappeared and still provides scope for significant future gain

TABLE 12  
IMPACT OF STRUCTURAL SHIFT IN EMPLOYMENT ON GROWTH OF GDP PER PERSON EMPLOYED, 1950-84  
(annual average compound growth rates)

	Actual Rate of Growth of GDP per Person Employed		Rate of Growth of GDP per Person Employed Assuming Employment Structure Unchanged and with Actual In-sector Productivity Growth		Impact of Proportionate Sectoral Shift in Employment on Growth of GDP per Person Employed

Average	4.25	1.72	3.88	1.80	0.37	-0.08

Source: First two columns from Table 19. Otherwise, sectoral GDP from OECD data supplemented by national sources; sectoral employment derived from Tables A-7 and A-13. For sectoral productivity growth see Table A-6. Figures on hours worked per person by sector were not available on a reliable basis. For the 1913-50 estimates in Table 19, the sources for GDP by sector were Carré, Dubois, and Mahinvaud (1972) for France, Walter Hoffmann (1965) for Germany, Ohkawa and Shinohara (1979) for Japan, Feinstein (1972) for the U.K., and Kendrick (1977) for the U.S.

in Japan, but it is not what it used to be.

In the past there was always some structural "drag" from movement into the slow-growing service sector, but this was compensated for by its being a relatively high productivity sector. Now, however, this "drag" is much bigger than it was. The service sector is bigger than in the past, the level of service productivity is lower than that in industry, and deindustrialization of employment in favor of services is increasingly prevalent.

The contribution of structural change to growth was generally most favorable in 1950-73 and least favorable in 1973-84 (when it was actually negative for four of the countries). Over the whole period since 1913 it was most favorable for Japan, which started with the biggest agricultural sector, and least favorable for the

Netherlands, the most "mat-

Table 12 shows the structural effect of a three-sector classification of the economy: movement in agriculture, industry, and services. It shows what the growth rate of output per man would have been if the structure of employment had not changed and if productivity growth in each sector remained as actually experienced.

Virtually all growth analysts attach importance to structural change, particularly in the form of labor migration from low to high productivity sectors. It is treated as a similar add-on supplement to total factor productivity analysis in the cross-country studies of Denison (1967), Denison and Chung (1976), and Kendrick (1981), as well as in the national

TABLE 13  
CHARACTERISTICS OF PERFORMANCE LEVELS IN THE LEAD COUNTRY (U.S.) AND THE FIVE FOLLOWER COUNTRIES IN 1984  
(U.S. = 100)

U.S.	100	100	100	100	100	100	100	100	100	100	100	100

Source: In this table a figure less than 100 represents less favorable performance levels than in the U.S., a figure above 100 represents a situation more favorable than in the U.S. Most of the figures on levels are derived from the appendix tables with weights similar to those used in Table 20, that is, female employees are weighted 0.6, male employees 1; a year of primary education is given a weight of 1, secondary education 1.4, and higher education 2. The level of the nonresidential capital stock was derived in the same way for all countries as described in Table 10, which produced capital output ratios at constant national prices in 1984 of 3.12 in France, 3.48 in Germany, 3.75 in Japan, 3.60 in the Netherlands, 3.28 in the U.K., and 2.74 in the U.S. These figures were converted into 1984 dollars at U.S. purchasing power parity (PPP) using the GDP figures in Table A-1, and the relative PPPs for investment goods in 1980 in Ward (1985, p. 87). Modernity of capital stock is derived from Table 10, land area from World Bank (1986), scale of economy from Table A-1

monographs on France, Japan, and the U.K. Kendrick (1961) and Gollop and Jorgenson (1980) in their studies on U.S. growth treat it differently, within their factor productivity analysis, by disaggregating the economy into many more sectors than we have done.

### B. *The Catch-Up Bonus*

Between 1913 and 1984, the U.S. had a higher level of real per capita income and labor productivity than all of the other countries, a "leadership" that had emerged around 1890 when U.S. productivity overtook that in the U.K. The initial dynamism of the U.S. came from its comparatively greater advantage in natural resources, its higher investment rates, higher levels of education and research. With time, the larger scale of the U.S. economy became increasingly pronounced, and this also may have contributed something to the U.S. lead. During 1913–50 the leader-follower gap was widened because European and Japanese growth was adversely affected by war.

In the long run, as U.S. natural resource advantages become less significant, as the mechanisms for technical diffusion are improved, as levels of human and physical capital per head in the other countries come closer to U.S. levels, and the scale of markets is widened by international trade, there are strong reasons for expecting a convergence of productivity levels, and indeed, in the period since 1950 this process has been very clear (see Tables 3 and 13).

If the follower countries follow an appropriate policy mix and are not disturbed in the convergence process by war, they should be able to increase productivity at a faster pace than the lead country. They enjoy "opportunities of backwardness," which means that over a considerable range of technology they can emulate the leader and get a given amount of growth with less expenditure

on research and development. They can push the rate of capital formation per worker faster without running into diminishing returns, and structural change is rapid. Most of these effects enter into the accounts elsewhere, but when countries mount a successful process of catch-up, they are in a "virtuous circle" situation, which we have assumed will provide an extra efficiency bonus augmenting the yield of factor inputs and other growth components in a way that is not true of the lead country, which is nearer to a "best-practice" situation over a wide range of productive activity.

I assume this catch-up bonus to be a function of both (a) the size of the gap between a particular follower country and the lead country and (b) the rate at which the productivity gap is being narrowed. The size of the gap at different periods can be seen in Table 3; the rate of convergence can be seen in Table 19. It was assumed that the rate of bonus when the gap is being narrowed, as it was in 1950–84, was 20 percent of the convergence rate. There are strong reasons to think that the catch-up benefits were a significant part of the growth process, though the particular estimates have chosen. The catch-up element in our model is speculative.

The catch-up effect in the follower countries was biggest in Japan, which had the lowest starting position in 1950 (14 percent of U.S. levels) and the fastest growing economy. It was least in the Netherlands and the U.K., whose position was nearest to the U.S. in 1950. In the U.S., of course, it was zero. When the follower countries have converged on the U.S., this effect will ultimately wither away. High rates of investment will be less profitable and more R and D will be necessary (see Table A-24). Generally speaking, the catch-up effect

was weaker in 1973–84 than in the golden age (1950–73) except in the U.K.

It can be seen from Table 13 that the process of convergence has already advanced rather far in this group of countries. The average lag of the followers is now very small for levels of fixed capital, but more marked for education and R and D. The U.S. advantage in natural resource endowment (for which the land and energy ratios are a rough proxy) and in the scale of its internal market is still very large indeed, but these two influences are not very significant now because (a) these particular follower countries have offset the smaller size of their national markets to a large extent by opening their economies to international trade and (b) there have been giant strides in transport technology, which makes the locus of natural resources less important than was once the case.

A catch-up bonus does not figure in many versions of growth accounts, but it plays a major role in Helliwell, Sturm, and Salou (1985) whose hypothesis is different, that is, convergence on growth rates in the lead country rather than on its level. There is an analogous element of this kind in Denison (1967), which he classifies as an economy of scale due to differing "income elasticities." Although Denison's terminology and method of calculation are different, the size of his coefficients and their inverse distribution by initial level of productivity are similar to those presented here.

### C. Foreign Trade Effect

Since 1913, the foreign trade regimes of these countries have undergone major changes that have had some effect on output growth. In the 1913–50 period, trade was adversely affected by the growth of tariffs, quantitative restrictions, and exchange controls. In 1950–73, tariffs were removed on a great part of the intertrade of the four European countries within the

TABLE 14  
RELATION BETWEEN GROWTH OF GDP AND FOREIGN

Average GDP Growth	1.85	5.31	2.10

Source: Table 19.

European community, and on a world-wide basis for all six countries by successive GATT rounds. Quantitative restrictions on nonagricultural products were greatly reduced, and exchange controls were reduced to negligible proportions.

As a result, foreign trade volume grew more slowly than GDP in all the countries in 1913–50 and faster in all the countries in 1950–73.

After 1973, the tariff reduction process was much less significant, and in some items, quantitative restrictions on trade have grown. Trade volume in 1973–84 was still faster than GDP but to a less marked degree than in 1950–73 (see Table 14).

In 1950–73 the growth of trade strengthened international specialization and competition through the removal of trade barriers and gave the European countries some of the traditional American advantages of large internal markets. The prices of products entering foreign trade, both imports and exports, rose a good deal less than the overall price deflators, in a way that was not true after 1973.

We have assumed that foreign trade produced ten percent economies of scale in the first and last periods, and 20 percent in 1950–73 (see source note for Table 20). For 1950–73, we assumed that the efficiency impact of a given percent-

TABLE 15a  
DIFFERENCE BETWEEN GROWTH RATES OF ENERGY CONSUMPTION AND GDP  
(annual average compound growth rates)

	1913-50	1950-73	1973-84	Difference 1950-73 Minus 1913-50	Difference 1973-84 Minus 1950-73
France	-0.66	-0.52	-2.06	0.14	-1.54
Germany	-1.30	-1.22	-2.15	0.08	-0.93

Average	-0.87	-0.34	-2.54	0.53	-2.20

Source: Table 19.

age expansion of trade was greater because of the intense policy effort to reduce barriers, which produced an unprecedented fall in the relative price of items that entered international trade.

#### D. Economies of Scale at the National Level

In neoclassic versions of growth accounts (e.g., in Jorgenson's work), it is assumed that there are constant returns to scale, but in all of Denison's studies, a significant scale bonus is assumed to occur as national markets increase in size. In Denison (1967), scale economies at the national level represent about 9 percent of growth, and their importance is similar in Kendrick (1981). Ohkawa and Rosovsky (1973) also attribute importance to economies of scale.

In fact, empirical evidence on economies of scale is scarce. Economies of scale are difficult to calculate in cross-section studies because of interfirm variations in vintages of capital, and, in time series, it is difficult to disentangle scale economies from the effects of technical progress. In a careful study, Zvi Griliches and V. Ringstad (1971) found economies of scale in Norwegian manufacturing to be

between 6 and 7 percent, but because Norway is a very small economy, and scale economies are not as likely in the rest of the economy as in manufacturing, I assume that the scale bonus at the national level for these six countries is only 3 percent of GDP growth.

#### E. The Energy

Over the long run, economies have been in the process of energy economizing, as seen from Table 15a. In the two periods, all six countries had a slower growth in energy consumption than GDP (except for the Netherlands in 1950-73).

In 1950-73, there was somewhat less energy economizing than in the previous period, but given the relative cheapness of energy, this change was not big enough to affect aggregate economic growth, except in the Netherlands.

In 1973-84, however, as a result of the OPEC shocks, energy prices rose tenfold in two successive leaps, and this led to a sharp increase in the pace of energy economy. In all countries this process reduced growth rates.

There is considerable controversy about the impact of energy substitution

TABLE 15b  
ACTUAL AND HYPOTHETICAL GROWTH OF GDP PLUS ENERGY CONSUMPTION  
(annual average compound growth rates)

	Actual		Hypothetical		Actual minus Hypothetical

on economic growth. John Tatom (1981) attributed almost all of the 1973 U.S. slowdown to the direct impact of the energy problem, but Denison (1985) gave energy a much more modest role. My procedure for calculating the energy effect is similar to that in Denison (1985).

Viewed over the long run, the energy-economizing processes of 1973-84 look more like a temporarily accentuated version of a long-term trend rather than the catastrophe they seemed to be at the time.

I have made a rather modest estimate of the growth impact of the changed energy situation, as shown in Table 15b. This table compares the actual growth of GDP grossed up by adding energy inputs, with a hypothetical situation that would have occurred if it had been possible to maintain the relation between energy growth and GDP growth in the previous period.

It is clear that the need for energy economy retarded growth generally in 1973-84, and the biggest drag was in the Netherlands, which had built up an industrial structure in the golden age that was energy intensive.

The energy effect thus derived is intended to reflect only the direct impact

on GDP growth. The OPEC shocks clearly had bigger indirect effects on the conjuncture as they exacerbated inflation and created payments problems that induced deflationary policies. They also worsened real GNP (as opposed to GDP) through their terms of trade effect.

#### F. *Effects of Natural Resource Discovery*

In general I have not taken into account the role of land and natural resources in growth, but it seemed worth considering the role of Dutch exploitation of natural gas discoveries, which boosted output growth strongly from 1968 to 1974, and British exploitation of North Sea oil and gas, which boosted British growth from 1976 to 1983. Neither of these bonanzas had counterpart elsewhere in these countries.

For the 1950-73 period as a whole, natural gas growth accounted for 8 percent of the increment in Dutch real GDP, and in the U.K., in 1973-84, mining output represented 42 percent of U.K. GDP growth (measuring in both cases at 1980 prices). If all of the increment in this new energy production in these two countries had been a natural resource windfall, one could say that it

raised the Dutch GDP growth rate for 1950–73 from 4.46 to 4.70 percentage points a year, and British GDP growth in 1973–84 from 0.63 to 1.06 percentage points a year.

However, these output gains were not entirely due to natural resource windfalls. North Sea oil exploitation involved heavy capital costs and resource diversion, so we allocate only half of its contribution to natural resource augmentation. In the case of the Netherlands, the resource costs of developing Groningen gas were a good deal smaller, so we have taken 80 percent of the increment as the contribution of natural resources.

#### *G. Costs of Government Regulation and Crime*

Over the past fifteen years, all these countries stepped up government regulation. To some degree the regulation was intended to improve the quality of the environment, safety, or welfare or to offset the impact of increased criminality or terrorism. The corresponding improvements are not included in measured GDP, but the cost of achieving them has had some retarding impact on output growth. The costs have probably been most marked in the United States, where their impact has been strengthened by the presence of an exceptionally large legal profession, a tradition of litigation, and an adversary relationship between government and business.

Denison (1985, p. 111) estimated for 1973–82 that U.S. government regulation for pollution abatement reduced measured national output growth by 0.09 percentage points a year and that the cost of dishonesty and crime reduced measured growth by 0.05 percentage points a year. Worker safety and health regulation reduced growth by a further 0.02 points, making a total of 0.16 points a year. In 1948–73 the combined drag from these causes was smaller at 0.04 points.

For the U.S. these Denison results are used for our last two periods. For other countries I assume the pollution abatement and crime factors to be only half of that in the U.S. because other countries have fewer lawyers, less crime, and regulatory agencies that are much more sensitive to the wishes of business (see Maddison 1984a for a fuller statement). I assume that new worker safety and health regulation was unimportant in other countries.

#### *H. Labor Hoarding/Dishoarding*

In normal circumstances one would not expect labor hoarding or dishoarding to be significant in advanced capitalist economies over a period of years because market forces would cause workers to be laid off if they ceased to be productive. Even in cases where labor legislation restricts the freedom to fire and hire, labor turnover will solve the employer profitability problem by attrition over a number of years.

However, Japanese companies in the 1970s had a high ratio of permanent to temporary employed or part-time workers. This proportion was 1.5 in 1970, 1.6 in 1981, and 1.7 in 1984. In the U.S., by contrast, permanent employees' shares were 1.0 in 1970, 0.9 in 1981, and 0.8 in 1984. Japanese workers have long-term employment contracts, but employers can get rid of them if they are very flexible, with maximum bonuses that move with business profits and can amount to a third of earnings in normal times. These bonuses can be squeezed to zero in depressed conditions, which makes it fairly easy for employers to retain workers rather than lay them off. In these conditions, one cannot rely on Japanese unemployment figures to provide a guide to labor slack.

In 1950, it is clear that there was a large degree of underemployment in Ja-

pan. Official unemployment stood at only 1.9 percent of the labor force, but GDP was only 71.5 percent of its 1939 level. I assumed that labor hoarding amounted to a quarter of employment in 1950 and that this labor had been fully dishoarded by 1973. By 1984, there is likely to have been some element of labor hoarding again in Japan, given the very rapid deceleration in growth rates after 1973, with very little movement in the official unemployment count. I assumed, somewhat arbitrarily, that 3 percent of 1984 employment represented disguised unemployment.

The result of these hypotheses can be seen in Table 20 where labor hoarding had a significant negative impact on growth in 1913–50, and in 1973–84, and dishoarding favored growth in 1950–73.

In Germany too, in 1950, recovery of prewar production levels was not complete, and the production structure was in disequilibrium. There was scope for labor hoarding, for 31 percent of employed persons were self-employed or family workers. For Germany, therefore we assumed 10 percent labor hoarding in 1950, and complete dishoarding over the period 1950–73.

### *I. Use of Capacity Effect*

The “use of capacity” adjustment is meant to deal with abnormal situations in terminal or initial years of the periods we have used and was applied only to Germany and Japan in 1950.

In both these economies, I assumed that the slack in the use of physical capital paralleled that in the labor market. In the Japanese case the labor slack consisted of labor hoarding, and in Germany it included both labor hoarding and overt unemployment.

For other countries, no “use of capacity” adjustment was made. The three benchmark years 1913, 1950, and 1973

were all years of high conjuncture in these countries, and although this was definitely not the case for 1984, the low “level of demand” in the latter years was the result of a decade of stagnation in which businessmen had had time to offset the surplus capacity that obviously did prevail within part of the period by reducing the growth of the capital stock below what it would have been at full employment.

It should be noted that accounts such as ours which are concerned with actual growth do not deal fully with the impact of cyclical disturbance. This can only be done by constructing a separate set of “potential output” accounts and comparing the different elements therein with the corresponding “actual accounts” that we have constructed here. The actual accounts include only labor input actually employed, so they are net of cyclical unemployment (which was substantial in 1984).

Table 16 shows what employment inputs would have been in 1973–84 if the 1984 unemployment rate had been at 1973 levels and if everything else had remained as it was. The last column of Table 16 does not figure in our Table 20, because the latter deals with actual and not potential growth.

Denison is the only one of the growth accountants to have developed a full set of “potential output” accounts. In comparing the two sets of accounts in Denison (1985, pp. 111–12), one finds that the two main items are the loss in factor input of 0.71 points in 1973–82, and the loss in output per unit of input 0.35 points. Together they make up 1.06 points, that is, the difference between actual output growth of 1.55 percentage points a year and a potential growth of 2.61 points. The first item is mostly comprised of a loss because of unemployment of 0.68 points and the second is rather similar to the “intensity of demand” ef-

Average	0.38	1.03	0.65	0.45

Source: Tables A-7 and A-8. Column 4 is column 3 multiplied by the factor input weight of 0.7 for labor. As explained in the text, Table 16 shows only part of the output foregone because of cyclical slack. For a fuller analysis, see Maddison (1980a) and Denison (1985).

fect of 0.28 in Denison's "actual" accounts. These two total 0.96 and the rest is due to the imputed effects that full employment would have on working hours, activity rates for women, and structural effects.

Denison's potential output accounts are basically an elaboration of the Keynesian counterfactual first developed by Arthur Okun (1962) and used in simple forms subsequently by the U.S. Council of Economic Advisors. It does not attempt to estimate what output would have been if the capital stock had grown differently.

Several other growth accounts have included an "intensity of demand" effect, for example, Kendrick (1981), Carré, Du-bois, and Malinvaud (1972), and Helli-well, Sturm, and Salou (1985). The latter construct their estimate after calculating potential output by regression procedures, and their total cyclical effect is very large for 1973-82. The difficulty with regression analysis, however, is that if some elements are left out of the accounts, those that remain may take over a large part of their "explanatory" power

because of the close correlation of most elements in the growth process. This is well illustrated in our Table 21 where in a situation of acceleration most of the items in the account move in the same direction, and in Table 22 where in a situation of slow growth most of the explanatory items move in the same direction. We consider that the latter situation is more realistic. Salou (1985) comments on this point because the movement of the account for quality, capital growth, and structural effects.

#### *Summary Statement of Growth "Explained"*

We have proceeded through the accounts with successive augmentation of their scope. Each of our successive  $\Pi$ s (see Table 17b) is a kind of residual that shows how much growth is left "unexplained." The simplest statement, in terms of labor productivity,  $\Pi^1$ , explains at least, and, in particular, does not explain the acceleration/slowdown phenomena. Capital productivity,  $\Pi^2$ , performs much

TABLE 17a  
RESIDUAL (UNEXPLAINED) GROWTH ( $\dot{\Pi}^5$ )  
(annual average compound growth rates)

Average	0.42	1.17	0.38

Source: Table 20.

better in "explaining" output growth and the acceleration phenomenon, but not the post-1973 slowdown. Moreover, we know that this is only a very partial indicator. When capital is linked with labor in the joint factor productivity index  $\dot{\Pi}^3$ , more of growth is explained than with  $\dot{\Pi}^1$  but a large part of the acceleration/slowdown phenomenon is still "unexplained." Augmented joint factor productivity,  $\dot{\Pi}^4$ , explains more of

growth than  $\dot{\Pi}^3$ , but is not much good at explaining acceleration and slowdown. In moving from  $\dot{\Pi}^4$  to the  $\dot{\Pi}^5$  (residual) measure, we added nine components by way of explanation that are quantified in Table 20. For 1950-73, the "golden age,"  $\dot{\Pi}^5$ , "explains" a good deal more of growth than does  $\dot{\Pi}^4$ , and, as a consequence, it also reduces the mystery concerning acceleration and slowdown. One can therefore see clear gains in carrying the growth accounts beyond factor productivity analysis.

Table 18 summarizes the net explanatory power of the 14 growth components that were deployed in the causal analysis of Tables 20, 21, and 22. On average the degree of explanation is high and consistent, and the same is true for the explanation of the acceleration/slowdown phenomena. However, the degree of explanation varies significantly across countries, and, within each country, between periods. The weakest of the "explanations" is for the U.S. growth slowdown after 1973, and the strongest is for Japanese growth, and its variance between periods.

### Conclusions

The present survey is intended to show that growth accounts are a useful framework for assembling quantitative "facts" and quantified hypotheses about growth causality in a coherent way. Their usefulness is clear in interpreting developments in six countries over a 71-year period. The explanatory power of the exercise was quite powerful for the countries as a group, though for individual countries the degree to which growth was explained is not always consistent between periods. Some elements in the quantification are much more speculative than others. I therefore tried to keep the assumptions transparent so that the role of different influences can be modified by other analysts who may wish to make partial use of the quantitative framework.

This approach is particularly useful in comparative economic history, which in

the past has often been based on loose description, *intuitus*.

literary models of complexity and the elements in the variation in the simple or increasingly suspicious economic historians.

for better articulation of their facts and hypotheses, have come to use this type of analysis more frequently (see O'Brien 1986).

With the possible exception of those Cambridge economists in the Robinson-Sraffa tradition who still deny the measurability of capital, this approach should not raise serious ideological problems for any economist who concedes that the national accounts are useful. Some growth accountants are rigorously neoclassical, such as Jorgenson, but Denison has both neoclassic and Keynesian elements in his

*Source:* Derived from Table 19, using a weight of 0.70 for the labor components, 0.07 for residential capital, 0.23 for nonresidential capital, and 0.30 for capital quality. The catch-up effect was calculated by assuming a 20 percent bonus from the productivity convergence process, the structural effect is the same as in Table 19, the foreign trade effect is 10 percent of the trade growth shown in Table 19 for the first and last periods and 20 percent for 1950-73 multiplied by the trade to GDP ratios (average for imports and exports) shown in Table A.23. The energy effect is from Table 15b. Natural resource effect is described in the text. The U.S. regulation/crime effect is taken from Denison (1985, p. 111), for other countries the worker safety effect is not counted and the other U.S. effects are assumed to have had half the impact they had in the U.S. Economies of scale are 3 percent of GDP growth rate. Capacity use effect as described in text.

accounts, plus a large dose of Yankee ingenuity. Indeed, large elements in this kind of approach can be used by Marxists (see Thomas Weisskopf, Samuel Bowles, and David Gordon 1983 for an analogous endeavor).

It must of course be recognized that this approach mixes hard and soft evidence. The harder evidence relates to the measures of GDP, labor input, and capital stock, and even these are subject to revision in the light of more refined use of evidence. Most of the other components are soft evidence based on hypotheses on which there may be quite legitimate differences of opinion. This is true even for measures of the impact of education on labor quality on which there is a huge and very sophisticated literature. It is also clear that there is a great deal of interaction between causes, and particularly between capital growth and technical progress, which makes it difficult to assign separate significance to

each. For this reason, policy inferences from such accounts should be heavily qualified.

It should also be emphasized that this approach deals only with proximate causality, and one has to look behind this to institutions, ideology, sociopolitical conflicts, degree of sophistication of policy, system shocks such as wars, and other historical accidents to get a fuller picture.

This type of analysis would not have been possible 30 years ago, when measures of past growth were much scarcer, so a great deal is owed to the scholars who have prepared the ground. There is little doubt that the analysis can ultimately be pushed back further into the nineteenth century, as estimates of growth, and particularly, of capital stock are improved. This is all the more necessary as circumstances in the decades before 1913 were more normal than in 1913–50.

TABLE A-1  
REAL GDP LEVELS AT 1984 PURCHASING POWER PARITY, 1870-1984  
(\$ billion)

	France	Germany	Japan	Netherlands	U.K.	U.S.
1870	59.27	33.98	19.28	8.26	77.95	78.61
1890	78.58	54.43	31.01	n.a.	116.92	188.59
1913	119.99	111.75	54.76	20.33	174.78	454.53
1929	150.93	135.33	97.94	33.86	195.57	740.72
1938	144.93	188.97	134.54	34.89	231.58	698.00
1950	173.49	179.92	124.34	49.40	281.04	1,257.86
1960	271.03	387.21	295.17	76.99	372.80	1,735.92
1973	547.98	675.49	976.50	142.20	556.60	2,911.78
1984	694.70	811.60	1,468.40	168.90	625.20	3,746.50

Source: GDP movement 1870-1952 from Maddison (1982), except Japan 1913-40, from Ohkawa and Miyohei Shinohara (1979, pp. 278-80), 1940-50 derived from pp. 259-69; 1950-52 from Ohkawa and Rosovsky (1973, p. 289). 1952-84 and 1984 purchasing power parities from OECD(d) various issues. The level of U.S. GDP for 1984 was raised by \$111.9 billion in line with preliminary U.S. Dept. of Commerce revisions. All figures are adjusted to refer to product within the present-day geographic boundaries of the countries. This article was written before the revised U.S. national income and product accounts were fully available. Revised U.S. GDP in 1984 prices (on an OECD conceptual basis) is now as follows.

1870	80.11	1929	754.80	1960	1,793.38
1890	192.18	1938	708.49	1973	2,931.80
1913	463.18	1950	1,282.81	1984	3,713.02

These revisions (see OECD(d) 1960-85 edition and U.S. Department of Commerce, 1986) came too late to be incorporated in our analysis, but a rough check suggests that they do not lead to any serious change in our findings. In particular, they do not remove the sharp slowdown in the U.S. economy after 1973 which Darby (1984) suggested was an artifact deriving from official mismeasurement of GDP. It should be kept in mind that revisions in growth rates and levels of at least these dimensions can be expected to occur periodically in all the countries.

*Source:* As described in Maddison (1984a, p. 85), except for France and U.S. France 1870-90 revised from INSEE (1966, p. 43). U.S. 1910-50 from Stanley Lebergott (1964, p. 512) with female farm employment adjusted upward to maintain a uniform female/male farm ratio at Lebergott's 1940 level. See U.S. Dept. of Commerce (1975, Part I, pp. 127-28) for census figures on male and female farm employment. The figures for this period were then adjusted upward by 0.4121 percent to allow for the fact that Alaska and Hawaii were added in 1950. For 1938, New Deal relief workers were added to Lebergott's employment figure (see Michael Darby 1976). For 1870-1910 it was assumed that employment grew parallel with the population aged 15-64. Proportion of working age derived from U.S. Dept. of Commerce (1975, Part I, p. 15). For 1960-84 U.S. employment was augmented to include 14- and 15-year-olds (data supplied by BLS). All figures for all countries are adjusted to refer to the geographic area within 1984 frontiers.

1973	1,785	1,805	2,213	1,825	1,688	1,710
1984	1,554	1,676	2,149	1,640	1,518	1,632

Source: As described in Maddison (1984a, p. 85). Germany 1960 onward revised from IAB (Institut für Arbeitsmarkt- und Berufsforschung der Bundesanstalt für Arbeit) 1985/1. U.S. 1973 onward revised upward on the basis of Janice Hedges (1977) and Kent Kunze (1984). For 1960 onward the breakdown of the hours estimates was made as shown in Tables A-10 and A-11. For earlier years the procedure was cruder (see Maddison 1980a and Maddison 1982 for further detail of the procedures).

TABLE A-10  
ESTIMATED BREAKDOWN OF AVERAGE HOURS PER PERSON EMPLOYED IN 1983

	Net Hours <sup>a</sup> Worked per Day	Days Worked per Year	Hours Worked per Year
France	7.570	206.00	1,560
Germany	7.953	211.45	1,682
Japan	7.956	267.75	2,131
Netherlands	7.758	213.50	1,656
U.K.	7.344	205.83	1,512
U.S.	7.000	231.25	1,619

*Source.* Estimates derived by merging data from various sources. Methods and sources for France, Germany, and U.K. described in Maddison (1980a); updated figures for France kindly supplied by R. Granier. For other countries from the sources described in Maddison (1984a, p. 85). For the U.S., Kunze (1984) and Hedges (1977) served as guidelines, but I assume somewhat more time off as my employment figures for the U.S. include government workers and 14- and 15-year-olds.

<sup>a</sup> Includes impact of overtime, involuntary short-time, and voluntary part-time working

TABLE A-11

*Source.* OECD(h) (vol. I, pp. 31-108) and its underlying worksheets. methodology and classification were used for most countries. These give figures for postwar census years. 1913 was derived from postwar census information on education of older cohorts. Thus in the 1950 U.S. census the average levels of education for population aged 15-64 were roughly equivalent to those for people aged 43. It was assumed therefore that the average education level for 1913 would correspond approximately to the education level of people 80 years old in 1950, however, for most European countries, the postwar census simply assumed that everyone had completed the full primary cycle, which was obviously not correct for 80-year-olds. We therefore had to make somewhat rough assumptions for primary education levels in 1913. For France the 1913 levels were derived from Carré, Dubois, and Malinvaud (1972, p. 93), and for Japan the 1913 level is derived from Ohkawa and Rosovsky (1973, pp. 56-57). Matthews, Feinstein, and Odling-Smee (1982, p. 573) give estimates for England and Wales 1871-1961. These provide a cross-check on our crude figures, which are intended to cover the whole of the U.K.

1984	439.10	582.35	n.a.	n.a.	321.30	321.64

Source. France 1913–55 from Carré, Dubois, and Malinvaud (1972, pp. 189–204, and 659), updated by figures supplied by OECD for 1955–84. Germany 1870–1950 from Maddison (1982) updated from Statistisches Bundesamt (1986). Japan 1913–70 from Ohkawa and Shinohara (1979, pp. 366–69) with rough estimates for the 1940–54 link from capital formation figures in the same source; for 1970 onward the figures were updated by figures supplied by OECD for the private sector, and the increment in the stock of government capital was calculated by cumulating constant price investment figures in OECD(d) with scrapping derived from investment figures for earlier periods from Ohkawa and Shinohara. Netherlands 1913–50 and 1973–84 from methods used in Maddison and Wapstra (1982) assuming a 1913 capital output ratio of 2.1, 1950–73 from Henk-Jan Brinkman. U.K. 1870–1948 from Feinstein (1972), 1948–84 figures supplied by Central Statistical Office. U.S. 1926 net stock from Kendrick (1961, pp. 320–25), 1926–84 from John Muscatelli. All figures were adjusted to a midyear basis. The estimates for Germany and the U.K. and the estimates for France were presumed to be so adjusted.

## I. Why Study Auctions?

ONE PARTY TO AN EXCHANGE often knows something relevant to the transaction that the other party does not know. Such asymmetries of information are pervasive in economic activity: for example, in the relationship between employer and employee when the employee's effort cannot be monitored perfectly; between the stockholders and the manager of a firm; between insurer and insured; between a regulated firm and the regulatory agency; between the supplier and the consumers of a public good; between a socialist firm and the central planner; or (as is the subject of this paper) between buyer and seller when the value of the item is uncertain.

Forty years ago, F. A. Hayek criticized theories that purport to describe the price system but start from the assumption that individuals have symmetric information:

The peculiar character of the problem of a rational economic order is determined precisely by the fact that the knowledge of the circumstances of which production and consumption are part is distributed unequally. . . . In a free society the knowledge of the particular circumstances of which production and consumption are part is distributed unequally. . . . The problem of society is how to coordinate the separate individual actions so that the best use of resources known to any of the members of society, for ends whose relative importance only these individuals know. Or, to put it briefly, it is a problem of the utilization of knowledge which is not given to anyone in its totality. (Hayek 1945, p. 519)

Hayek went on to argue that to omit imperfections of information is to ignore the price system's chief advantage. The "marvel" of the price system is its efficiency in communicating information "in a system in which the knowledge of the relevant facts is dispersed among many people" (p. 525). All that a buyer or seller

needs to know to make a rational decision is the vector of prices; he need not know the determinants of supply and demand that underlie the prices.

Hayek's critique of extant theories of the price system applies equally to the most thorough current theory, the Arrow-Debreu model, which assumes either that information is perfect or, what is essentially the same thing, that a full range of markets in contingent commodities exists. To paraphrase Hayek in modern terms, the constraints imposed by informational asymmetries can be as significant as any resource constraints.

Is the market as effective at transmitting information as Hayek argued? The much-cited examples due to George Akerlof (1970) illustrate that it need not be. The inability of buyers of used cars to observe the quality of any one car might cause the used-car market to cease to function. Similarly, the working of medical-insurance markets is hindered by the inability of an insurance company to observe completely an individual's current state of health. Should we conclude that Hayek's claims for the informational efficiencies of the price system are unduly optimistic? Resolution of this question requires some systematic analysis of how economic agents behave when information is dispersed.

Some of the most exciting of the recent advances in microeconomic theory have been in the modeling of strategic behavior under asymmetric information. One part of this broad research program is the theory of bidding mechanisms. The modeling of auctions provides a narrowly defined set of questions with which to begin a rigorous examination of the implications for the price system of informational asymmetries.

The study of auctions provides one way of approaching the question of price formation. As was pointed out in a well-known article by Kenneth Arrow (1959),

the standard economic model of many small buyers and sellers, taking as given the market price, is lacking in that it fails to explain where prices come from. Once the *deus ex machina* of the Walrasian auctioneer is discarded, who sets prices? Even in an otherwise perfectly competitive market, Arrow argued, during the process of price formation there is considerable uncertainty, resulting in each seller facing a downward-sloping demand curve or each buyer facing an upward-sloping supply curve. During the adjustment to the competitive equilibrium, "the market consists of a number of monopolists facing a number of monopsonists" (p. 47). Auction theory provides one explicit model of price making (although it is a restricted model of price formation in that it ignores the bargaining aspects of the process sketched by Arrow).

A less fundamental but more practical reason for studying auctions is that auctions are of considerable empirical significance: The value of goods exchanged each year by auction is huge. This fact in itself indicates that some theoretical study of auctions is warranted. Moreover, as will be seen, the theory of auctions is closer to applications than is most frontier mathematical economics.

The theoretical results in auction theory can explain the existence of certain trading institutions, and perhaps can even suggest improvements in the existing institutions: Thus auction theory has both positive and normative aspects. Many of the results address the question: What is, from the point of view of the monopolist, the best form of selling mechanism to use in any particular set of circumstances? Other questions that can be answered include the following. Should the seller impose a reserve price? If so, at what level? Can the seller design the auction so as to achieve price discrimination among the bidders? Is it ever in the seller's interest to require payment

from the unsuccessful bidders? If it is feasible to make payment depend not only on the bid but also on something correlated with the true value of the item (as is the effect of royalties, for example), should the seller do so? Should the seller release any information he has about the item's true value? What can the seller do to counter collusion among the bidders?

This paper surveys recent developments in the theory of bidding mechanisms and discusses the relevance of the theoretical results for auctions in practice.<sup>1</sup>

In what follows, theorems will be stated in italics. For ease of exposition, not only will the proofs of the stated results be omitted, but also some of the required technical assumptions. For precise statements of assumptions, as well as proofs, see the cited papers.<sup>2</sup>

## II. The Types and Uses of Auctions

What is an auction? An auction is a market institution with an explicit set of rules determining resource allocation and prices on the basis of bids from the market participants.

What kinds of goods are sold by auc-

tion? The list is long: Artwork, books, antiques, agricultural produce, mineral rights, United States Treasury bills, corporations, and gold are some current examples; wives and slaves are historical examples (Ralph Cassady 1967; Martin Shubik 1983). Why are auctions used rather than other selling devices such as posting a fixed price? According to Cassady (1967, p. 20): "One answer is, perhaps, that some products have no standard value. For example, the price of any catch of fish (at least of fish destined for the fresh fish market) depends on the demand and supply conditions at a specific moment of time, influenced possibly by prospective market developments. For manuscripts and antiques, too, prices must be remade for each transaction. For example, how can one discover the worth of an original copy of Lincoln's Gettysburg Address except by auction method?"

Sometimes there is a single buyer who wishes to purchase some item from one of a set of potential sellers. In this case, the auction is essentially the reverse of the usual one. From reversal, the term *procurement auction* is derived. Thus, a *procurement auction* is defined as a sale in which the seller chooses the highest bidder. The term *procurement auction* is used to describe the process of bidding to buy. For the sake of brevity, we shall usually discuss auctions as mechanisms for selling.<sup>3</sup>

Governments are the most prominent users of procurement auctions. In a modern market economy, the government's purchases from private firms typically account for about 10 percent of gross domestic product. For many government contracts, firms submit sealed bids; the contract is required by law to be awarded to the lowest qualified bidder. Sealed-bid tenders are sometimes also used by firms procuring inputs from other firms.

<sup>1</sup> Because there already are a survey (by Richard Engelbrecht-Wiggans 1980) and a bibliography (by Robert Stark and Michael Rothkopf 1979) of the earlier literature, this paper will focus on recent developments. The surveys by Paul Milgrom (1985, 1986) cover in more depth a narrower range of topics than the present survey. A brief survey of auction theory is given by Robert Wilson (1987).

<sup>2</sup> To the reader interested in pursuing auction theory more deeply than this nontechnical survey, we recommend beginning with the following papers. William Vickrey's remarkable 1961 paper, two decades ahead of its time, is still worth reading as an introduction to the analysis of auctions. Milgrom and Robert Weber (1982a) provide a very general framework for analyzing auctions and compare different auction forms and different seller policies. On the designing of optimal auctions, the central papers are Roger Myerson (1981) and John Riley and William Samuelson (1981); the former paper is more general, but the latter is more readable.

Novel uses of auctions include the auctioning of the rights to a natural monopoly as a substitute for regulating it (Harold Demsetz 1968; Oliver Williamson 1976); the auctioning of import quotas as a way of generating data on the extent of protection afforded by the quotas as well as capturing the rents for the government (M. Pickford 1985); the use of an auction mechanism for selecting a location for noxious facilities like prisons and hazardous-waste disposal plants (Howard Kunreuther and Paul Kleindorfer 1986); and the auctioning of airport time slots to competing airlines, proposed as an improvement over the existing slot quotas (S. J. Rassenti, V. L. Smith, and R. L. Bulfin 1982).

In a double auction, several buyers and several sellers submit bids simultaneously. The double auction is a stylized representation of organized exchanges such as stock exchanges and commodity markets.

What are the types of auctions that are in use? Four basic types are used when a unique item is to be bought or sold: the English auction (also called the oral, open, or ascending-bid auction); the Dutch (or descending-bid) auction; the first-price sealed-bid auction; and the second-price sealed-bid (or Vickrey) auction.

The English auction is the auction form most commonly used for the selling of goods. In the English auction, the price is successively raised until only one bidder remains. This can be done by having an auctioneer announce prices, or by having bidders call the bids themselves, or by having bids submitted electronically with the current best bid posted. (The word "auction" is derived from the Latin *augere*, which means "to increase.") The essential feature of the English auction is that, at any point in time, each bidder knows the level of the current best bid. Antiques and artwork, for

example, are often sold by English auction.

The Dutch auction is the converse of the English auction. The auctioneer calls an initial high price and then lowers the price until one bidder accepts the current price. The Dutch auction is used, for instance, for selling cut flowers in the Netherlands, fish in Israel, and tobacco in Canada.

With the first-price sealed-bid auction, potential buyers submit sealed bids and the highest bidder is awarded the item for the price he bid. The basic difference between the first-price sealed-bid auction and the English auction is that, with the English auction, bidders are able to observe their rival's bids and accordingly, if they choose, revise their own bids; with the sealed-bid auction, each bidder can submit only one bid. First-price sealed-bid auctions are used in the auctioning of mineral rights to U.S. government-owned land; they are also sometimes used in the sales of artwork and real estate. Of greater quantitative significance is the use, already noted, of sealed-bid tendering for government procurement contracts.

Under the second-price sealed-bid auction, bidders submit sealed bids having been told that the highest bidder wins the item but pays a price equal not to his own bid but to the second-highest bid (Vickrey 1961). While this auction has useful theoretical properties, it is seldom used in practice.

Many variations upon these four basic auction forms are used. For example, the seller sometimes imposes a reserve price, discarding all bids if they are too low (Cassady 1967, Ch. 16). Bidders may be allowed only a limited time for submitting bids (Shubik 1983, pp. 45-49). The auctioneer may charge bidders an entry fee for the right to participate (Kenneth French and Robert McCormick 1984). Payment may be made to depend

not only on bids but also on something correlated with the true value of the item, as is achieved by using royalties (James Ramsey 1980). In an English auction, the auctioneer sometimes sets a minimum acceptable increment to the highest existing bid (B. S. Yamey 1972). The seller might, instead of selling the item as a unit, offer for sale shares in the item (Wilson 1979).

Two broad questions are prompted by the foregoing description of the use of auctions. First, why is an auction used rather than some other selling (or buying) procedure? Second, given the diversity of types of auctions, what determines which particular auction form is chosen? In order to address these questions, some theoretical machinery is needed.

### III. *The Ability to Make Commitments*

Auctions are often used by a monopolist (an individual selling a unique work of art, a government selling mineral rights, etc.) or a monopsonist (a government contracting out the production of a public good); they are sometimes also used in a competitive setting (in the selling of fish or agricultural produce, for example). This survey will follow the existing literature by considering the case of monopoly or monopsony; competition among the organizers of auctions will be little discussed.<sup>3</sup> (However, there may be any number, large or small, of bidders.)

It is presumed therefore that there is monopoly (or monopsony) on one side of the market. While it is possible in auctions that there are very many bidders so that perfect competition prevails, more usually there are only a few bidders: There is oligopsony (or oligopoly) on the other side of the market. In classical economics, monopoly-oligopsony

problems were regarded as indeterminate: Any outcome between all of the gains from trade going to the buyer and all of the gains going to the seller was seen as possible.

Auction theory sidesteps such bargaining problems by presuming that, in a sense, the monopolist (or monopsonist) has all of the bargaining power. More precisely, it is assumed that the organizer of the auction has the ability to commit himself in advance to a set of policies. He binds himself in such a way that all of the bidders know that he cannot change his procedures after observing the bids, even though it might be in his interest *ex post* to renege. In other words, the organizer of the auction acts as the Stackelberg leader or first mover.

Commitment matters because even as simple an institution as the first-price sealed-bid auction leaves the seller with a temptation to renege. As will be seen, the bidders submit bids that are functions of their valuations of the item for sale. Given the assumptions that the seller is able to deduce the highest valuation of the item from the bids, and that he sticks to his promise to sell the item to the highest bidder at a price no less than the highest bid and yet slightly less than the highest valuation, and it would be in the interest of the bidder who has that valuation to accept this offer. Of course, if the bidders knew in advance that the seller might renege on his announced policy, they would not bid as hypothesized.

The advantage of commitment is that procedures can be adopted that induce the bidders to bid in desirable ways. In *The Strategy of Conflict*, Thomas Schelling explained the advantages in general strategic situations of commitment power: "If the buyer can accept an irrevoc-

<sup>3</sup> An important exception, the double auction, will be discussed in Section XI.

cable *commitment*, in a way that is unambiguously visible to the seller, he can squeeze the range of indeterminacy down to the point most favorable to him" (Schelling 1960, p. 24). This follows from "the paradox that the power to constrain an adversary may depend on the power to bind oneself" (p. 22).

There are many ways commitment can be achieved. For example, in the case of government contracting, the government official responsible for the decision is required to follow procedures that are explicitly and precisely set out in a publicly available book of rules. Also, a "potent means of commitment, and sometimes the only means, is the pledge of one's reputation" (Schelling 1960, p. 29): The cost of reneging on a current commitment might be the inability to commit oneself credibly in future transactions, and therefore the loss of future bargaining power.

Nevertheless, it does not follow from that fact that one party has the ability to make commitments that he can extract all of the gains from trade. What limits his bargaining ability is the asymmetry of information: The seller does not know any bidder's valuation of the item for sale. If the seller were able to observe bidders' valuations, he could offer the item to the bidder who values it the most at a price slightly below this bidder's valuation, threatening to refuse to sell it if this offer is rejected. Given that the seller has so committed himself, it is in the bidder's interest to accept this take-it-or-leave-it offer; the commitment makes the threat credible. When information is asymmetric, the seller's ability to extract surplus is more limited. The seller can exploit competition among the bidders to drive up the price; but usually the seller will not be able to drive the price up so far as to equal the valuation of the bidder who values the item the most,

because the seller does not know what this valuation is.<sup>4</sup>

In the next section, we discuss in detail the asymmetry of information about bidders' valuations.

#### IV. *The Nature of the Uncertainty*

Asymmetry of information is the crucial element of the auction problem. In the case of perfect information, the auction problem is easily solved, as just noted: Given the ability to make commitments, the organizer of the auction extracts all of the gains from trade. Indeed, the reason a monopolist chooses to sell by auction rather than, say, simply posting a price is that he does not know the bidders' valuations.<sup>5</sup>

How the bidders respond to uncertainty depends on their attitudes toward risk. Thus one aspect of any particular bidding situation that the modeler must take into account is the bidders' risk attitudes. (The risk attitudes of the seller may also matter; however, we shall assume throughout that the seller is risk neutral.)

Differences among the bidders' valuations of the item can arise for either of two distinct reasons. Which of these is relevant also affects how any particular bidding situation is to be modeled.

At one extreme, suppose that each bidder knows precisely how highly he values

<sup>4</sup> Milgrom (1986) showed within a bargaining model that even if a seller is in a weak bargaining position (that is, if he does not have commitment ability), he might still choose to sell by auction. However, he then cannot use any of the strategic policies discussed in Sections VI through X to follow (such as imposing a reserve price). Hence we shall follow most of the existing literature by retaining the assumption of precommitment throughout this paper.

<sup>5</sup> Note that informational asymmetries may or may not be removable in principle. On the one hand, for example, tastes are inherently unobservable. On the other hand, it might be feasible to monitor a firm's production costs, but simply too costly to do so. This distinction will be ignored in what follows.

the item; he has no doubt about the true value of the item to him. He does not know anyone else's valuation of the item; instead, he perceives any other bidder's valuation as a draw from some probability distribution. Similarly, he knows that the other bidders (and the seller) regard his own valuation as being drawn from some probability distribution. Differences among the bidders' evaluations reflect actual differences in their tastes. More precisely, for bidder  $i$ ,  $i = 1, \dots, n$ , there is some probability distribution  $F_i$  from which he draws his valuation  $v_i$ . Only the bidder observes his own valuation  $v_i$ , but all the other bidders as well as the seller know the distribution  $F_i$ . Any one bidder's valuation is statistically independent from any other bidder's valuation. This is called the *independent-private-values model*. This model applies, for example, to an auction of an antique in which the bidders are consumers buying for their own use and not for resale. It also applies to government-contract bidding when each bidder knows what his own production cost will be if he wins the contract.

At the other extreme, consider the sale of an antique that is being bid for by dealers who intend to resell it, or the sale of mineral rights to a particular tract of land. Now the item being bid for has a single objective value, namely the amount the antique is worth on the market, or the amount of oil actually lying beneath the ground. However, no one knows this true value. The bidders, perhaps having access to different information, have different guesses about how much the item is objectively worth. If  $V$  is the unobserved true value, then the bidders' perceived values  $v_i$ ,  $i = 1, \dots, n$ , are independent draws from some probability distribution  $H(v_i|V)$ . All agents know the distribution  $H$ . This is called the *common-value model*.

Suppose a bidder were somehow to learn another bidder's valuation. If the common-value model describes the situation, learning someone else's valuation provides useful information about the likely true value of the item: The bidder would probably change his own valuation in the light of this. In contrast, if the independent-private-values model describes the situation, the bidder knows his own mind; learning about another's valuation will not cause him to change his own valuation (although he might, for strategic reasons, change his bid).

The independent-private-values model and the common-value model should be interpreted as polar cases: Real-world auction situations are likely to contain aspects of both simultaneously. For example, the bidders at an antiques auction may be dealers guessing about the ultimate market value of the item; but these dealers may differ in their selling abilities, so that the ultimate market value depends on which dealer wins the bidding. In the *oil-field* contract, there are differences in the abilities and a commercial uncertainty.

A general model of auctions among the bidders includes as special cases both the common-value model and the independent-private-values model was developed by Milgrom and Weber (1982a). With  $n$  bidders, let  $x_i$  represent a private signal about the item's value observed by bidder  $i$ ; let  $x = (x_1, \dots, x_n)$ . Let  $s = (s_1, \dots, s_m)$  be a vector of variables that measure the quality of the item for sale. The bidders cannot observe any of the components of  $s$ , however, some or all of the components of  $s$  may be observable by the seller. Now let the  $i$ th bidder's valuation of the item be  $v_i(s, x)$ . Thus any bidder's valuation may depend

not only upon his own signal, but also upon what he cannot observe: namely, the other bidders' private signals and the true quality of the item. This formulation reduces to the independent-private-values model when  $m = 0$  and  $v_i = x_i$  for all  $i$ ; and it reduces to the common-value model when  $m = 1$  and  $v_i = s_1$  for all  $i$ . The notion that bidders' valuations may to some extent be correlated is captured by the concept of *affiliation*: The vector of random variables  $(s, x)$  is affiliated if, roughly, some variables' being large makes it likely that the other variables are large: If variables are affiliated, then they are positively correlated.<sup>6</sup>

A further choice to be made by the modeler depends on the answer to the question: Are the bidders in some way recognizably different from each other? Is it appropriate to represent all bidders as drawing their valuations from the same probability distribution  $F$ , or should they be modeled as having different distributions  $F_i$ ,  $i = 1, \dots, n$ ? The former case will be described for the sake of brevity as the case of symmetric bidders and the latter as the case of asymmetric bidders. An example of an asymmetric bidding situation arises in government procurement when both domestic and foreign firms submit bids and, for reasons of comparative advantage, there are systematic cost differences between domestic and foreign firms.

<sup>6</sup> More precisely, let  $z$  and  $z'$  represent a pair of  $(m + n)$  vectors, and let  $g(z)$  denote the joint probability density of the random variables  $z$ . Denote by  $z \vee z'$  the component-wise maximum of  $z$  and  $z'$ , and by  $z \wedge z'$  the component-wise minimum. Then the variables are defined to be affiliated if, for all  $z, z'$ ,

$$g(z \vee z') g(z \wedge z') \geq g(z) g(z').$$

Assuming differentiability of  $g$ , this is equivalent to

$$\frac{\partial^2}{\partial z_i \partial z_j} (\log g) \geq 0,$$

where  $z_i, z_j, i \neq j$ , are elements of  $z$ . See Milgrom and Weber (1982a) for more details.

Yet another modeling consideration arising from uncertainty is that the amount of payment can only be made contingent upon variables that are observable to both buyer and seller. In some circumstances, the only such variables are the bids. In other circumstances, however, there are other mutually observable variables. If these other variables are correlated with the item's true value, it might be in the seller's interest to make payment depend on these other variables as well as the bids. For example, in mineral-rights auctions, royalties make the payment depend upon the amount of oil ultimately extracted as well as the winning bid.

The auction model that is the easiest to analyze is based on the following four assumptions.

- A1. The bidders are risk neutral.
- A2. The independent-private-values assumption applies.
- A3. The bidders are symmetric.
- A4. Payment is a function of bids alone.

This model will be referred to as the benchmark model; it will be discussed in Sections V and VI. However, many real-world auctions fail to satisfy these assumptions: The consequences of relaxing each of these assumptions, one at a time, will be discussed in Sections VII through X.<sup>7</sup>

The results to follow will describe bidding equilibria. Each bidder knows the rules of the auction that the seller has chosen and committed himself to. Bidder  $i$  knows his own valuation  $v_i$  (true valuation in the independent-private-values model, perceived valuation in the common-values model). Each bidder is assumed to know the number of bidders, their risk attitudes, and the probability

<sup>7</sup> Eric Maskin and Riley (1985) provided simple examples illustrating the effects of varying assumptions A1, A2, and A3.

distributions of valuations, and to know everyone else knows that he knows this, and so on.<sup>8</sup> Based on what he knows, each bidder decides how high to bid. At a Bayes-Nash equilibrium, each bidder bids an amount that is some function of his own valuation, such that, given that everyone else chooses his bid in this way, no individual bidder could do better by bidding differently.

One result can be obtained immediately, regardless of which of the assumptions about risk attitudes and value correlations apply: *The Dutch auction yields the same outcome as the first-price sealed-bid auction* (Vickrey 1961). This is because the situation facing a bidder is exactly the same in each auction: The bidder must choose how high to bid without knowing the other bidders' decisions; if he wins, the price he pays equals his own bid. Because of this result, we do not need to analyze the Dutch auction in what follows.

### V. The Benchmark Model: Comparing Auctions

Which of the four simple auction types (English, Dutch, sealed-bid first-price, sealed-bid second-price) should a seller choose? In what we are referring to as the benchmark model (defined by assumptions A1, A2, A3, and A4), this question has a surprising answer: It does not matter. Each of these auction forms yields on average the same revenue to the seller. At first glance, it may seem that this cannot be correct. For example, it might seem that receiving the highest bid, as in the first-price sealed-bid auction, must be better for the seller than

receiving the second-highest bid, as in the second-price sealed-bid auction. The answer, of course, is that the bidders act differently in different auction situations; in particular, they bid higher in a second-price auction than in a first-price auction.

Consider first the English auction. When will the bidders stop bidding up the price in the English auction? The second-last bidder will drop out of the bidding as soon as the price exceeds his own valuation of the item. Thus the highest-valuation individual wins the bidding and pays a price equal to the valuation of his last remaining rival. Usually this will be strictly below his own valuation of the item: *The successful bidder earns some economic rent in spite of the monopoly power of the seller.*<sup>9</sup>

Only the bidder knows how much rent he receives because only he knows his own valuation. From the point of view of an outside observer or the seller, how large on average is the winner's rent? To answer this question, suppose that the  $n$  bidders' valuations are, in dollar terms,  $v_{1,n}, \dots, v_{n,n}$ . Suppose  $v_{1,n}$  is the highest valuation,  $v_{2,n}$  is the second highest, etc. (that is,  $v_{1,n}$  is the first order statistic and  $v_{2,n}$  is the second order statistic). From the previous section, the winning bidder in the English auction pays a price equal to  $v_{2,n}$ , and thus receives a rent of  $v_{1,n} - v_{2,n}$ . From the point of view of the seller, the expected rent of the winning bidder is the expected difference between the first order statistic,  $v_{1,n}$ , and the second order statistic,  $v_{2,n}$ . The following result

<sup>8</sup> This is an instance of a game of incomplete information (John Harsanyi 1967, 1968). A strong assumption underlying the solution of any game of incomplete information is that the agents' subjective beliefs about the unknown parameters be mutually consistent; for expositions, see James Friedman (1986, pp. 48–56) and Myerson (1985).

<sup>9</sup> According to conventional wisdom, the excitement generated by the open calling of bids in an English auction can cause bidders to bid too high. Such an assertion of irrational behavior should be treated with caution: It may be explained by the observation that, by the nature of the auction process, all but two of the bidders believe the selling price exceeds the item's value.

can be proven using the properties of order statistics:<sup>10</sup> *The expected difference between the first order statistic and the second order statistic is the expected value of  $[1 - F(v_{(1)})]/f(v_{(1)})$ .* (This expectation is taken with respect to the distribution of the first order statistic  $v_{(1)}$  because the winner has valuation  $v_{(1)}$ .)

The amount the seller is paid by the winning bidder is, by definition of economic rent, the buyer's valuation minus the buyer's rent. Thus, from the preceding argument, the payment expected by the seller in an English auction is the expected value of  $J(v_{(1)})$ , defined by

$$J(v_{(1)}) = v_{(1)} - \frac{(1 - F(v_{(1)}))}{f(v_{(1)})}. \quad (1)$$

(The seller does not know the value of  $v_{(1)}$ , but the expected value of  $J(v_{(1)})$  is of course not a function of  $v_{(1)}$ .) It will be assumed throughout that the distribution  $F$  is such that  $J$  is a strictly increasing function: This simply means that the winning bidder's expected payment is increasing in his own valuation.<sup>11</sup>

Consider now the second-price sealed-bid auction. In this, each bidder's equilibrium strategy is to submit a bid equal to his own valuation of the item. To see this, note that, because it is a second-price auction, the bidder's choice of bid determines only whether or not he wins; the amount he pays if he wins is beyond

his control. Suppose the bidder considers lowering his bid below his valuation. The only case in which this changes the outcome occurs when this lowering of his bid results in his bid now being lower than someone else's and as a result this bidder now does not receive the item. Because he would have earned non-negative rents if he won, lowering his bid below his valuation cannot make him better off. Conversely, suppose he considers raising his bid above his valuation. The only case in which this changes the outcome occurs when some other bidder has submitted a bid higher than the first bidder's valuation but lower than his new bid. Thus raising the bid causes this bidder to win, but he must pay more for the item than it is worth to him; raising his bid above his valuation cannot make him better off (Vickrey 1961). This argument shows that, like the English auction, the second-price auction results in a payment equal to the actual valuation of the bidder with the second-highest valuation (that is, the realization of the second order statistic). Thus the expected payment is the expected value of  $J(v_{(1)})$ .

The outcomes of the English and second-price auctions satisfy a strong criterion of equilibrium: They are *dominant equilibria*; that is, each bidder has a well-defined best bid regardless of how high he believes his rivals will bid. In a second-price auction, the dominant strategy is to bid true valuation; in an English auction, the dominant strategy is to remain in the bidding until the price reaches the bidder's own valuation. By contrast, a first-price sealed-bid auction does not have a dominant equilibrium. Instead, the equilibrium satisfies the weaker criterion of *Nash equilibrium*: Each bidder chooses his best bid given his guess (correct in equilibrium) of the decision rules being followed by the other bidders.

A Nash equilibrium for a first-price

<sup>10</sup> A proof of this is given in McAfee and McMillan (1987f). For the case of bidders competing to sell an object rather than to buy (for example, bidding for contracts),  $[1 - F(v)]/f(v)$  is replaced by  $-G(c)/g(c)$ , where  $c$  is a bidder's production cost and  $G$  and  $g$  are the probability distribution function and density function of bidders' costs.

<sup>11</sup> For  $J$  to be an increasing function, the distribution function  $F$  must be sufficiently concave. Also,  $J$  is increasing if and only if  $[1 - F(v)]^{-1}$  is convex. When  $J$  is decreasing, it is in the seller's interest to choose the winner according to a random process; see Maskin and Riley (1980, 1983b), Myerson (1981), and Ralph Haywood (1984). For some examples of nonmonotonic  $J(v)$ , see Maskin and Riley (1984a, p. 183).

sealed-bid auction is found as follows. Consider the decision of bidder  $i$ , whose valuation is  $v_i$ . He conjectures that the other bidders are following a decision rule given by a bidding function  $B$ ; that is, he predicts that any other bidder  $j$  will bid an amount  $B(v_j)$  if his valuation is  $v_j$  (although bidder  $i$  does not know this valuation). Assume that  $B$  is a monotonically increasing function. What is bidder  $i$ 's best bid? If he bids an amount  $b_i$  and wins, he earns a surplus of  $v_i - b_i$ . The probability of winning with a bid  $b_i$  is the probability that all  $n - 1$  of the other bidders have valuations  $v_j$  such that  $B(v_j) < b_i$ ; this probability is  $[F(B^{-1}(b_i))]^{n-1}$ , where, as before,  $F$  represents the distribution of valuations. Bidder  $i$  chooses his bid  $b_i$  to maximize his expected surplus:

$$\pi_i = (v_i - b_i)[F(B^{-1}(b_i))]^{n-1}. \quad (2)$$

Thus he chooses  $b_i$  such that  $\partial\pi_i/\partial b_i = 0$ . By differentiating  $\pi_i$  with respect to  $v_i$ , we obtain  $d\pi_i/dv_i = \partial\pi_i/\partial v_i + (\partial\pi_i/\partial b_i)(db_i/dv_i) = \partial\pi_i/\partial v_i$ . (This is, of course, the Envelope Theorem.) Thus, by differentiating (2), an optimally chosen bid  $b_i$  must satisfy

$$\frac{d\pi_i}{dv_i} = \frac{\partial\pi_i}{\partial v_i} = [F(B^{-1}(b_i))]^{n-1}. \quad (3)$$

So far, we have examined bidder  $i$ 's best response to an arbitrary decision rule  $B$  being used by his rivals. Now impose the Nash (or rational-expectations) requirement: The rivals' use of the decision rule  $B$  must be consistent with the rivals' themselves acting rationally. Together with an assumption of symmetry (any two bidders with the same valuation will submit the same bid), this implies that bidder  $i$ 's optimal bid  $b_i$ , satisfying (3), must be the bid implied by the decision rule  $B$ —in other words, at a Nash equilibrium,  $b_i = B(v_i)$ . When we substitute this Nash condition into (3), we obtain an

equation defining bidder  $i$ 's expected surplus at a Nash equilibrium:

$$\frac{d\pi_i}{dv_i} = [F(v_i)]^{n-1}. \quad (4)$$

At a Nash equilibrium, all  $n$  bidders must be maximizing simultaneously, so that the condition (4) must hold for all bidders  $i = 1, \dots, n$ . We solve the differential equation (4) for  $\pi_i$  simply by integrating (using the boundary condition that if a bidder has the lowest possible valuation  $v_i$  then he earns zero surplus, implying  $B(v_i) = v_i$ ). Then we use the definition of  $\pi_i$  (equation (2)) plus the Nash condition  $b_i = B(v_i)$  to obtain each bidder's decision rule:

$$B(v_i) = v_i - \frac{\int_{v_i}^{v_1} [F(\xi)]^{n-1} d\xi}{[F(v_i)]^{n-1}}, \quad i = 1, \dots, n. \quad (5)$$

Note that this bidding function  $B$  is increasing, as was assumed. The second term on the right-hand side shows how much the bidder's bid exceeds his true valuation.

Note the two going arguments: bidder's best response and the Nash condition that he expects his rivals to be using.

The first argument gave rise to equation (3). Second, we imposed the Nash requirement that the conjectured decision rules are themselves consistent with optimizing behavior by the other bidders. This turned equation (3) into equation (4), which we then solved to yield (5).<sup>12</sup>

For the special case where the distribution of valuations  $F$  is uniform and the lowest possible valuation is zero, substiti-

<sup>12</sup> On existence, symmetry, and uniqueness of bidding equilibria, see Maskin and Riley (1986) and Milgrom and Weber (1985).

tution into (5) shows that a bidder with value  $v$  in a first-price sealed-bid auction submits a bid of  $B(v) = (n-1)v/n$ ; that is, he bids a fraction  $(n-1)/n$  of his valuation.

The winning bidder is the individual with the highest valuation  $v_{(1)}$ . In choosing his bid, each bidder assumes his valuation is the highest,  $v_{(1)}$ , because this presumption is costless if incorrect as losers pay nothing. It can be shown that  $B(v_{(1)})$  as in (5) is equal to the expected second-highest valuation conditional on the bidder's information, which is that his own valuation is  $v_{(1)}$ . (In other words,  $B(v_{(1)})$  is the expected value of the second order statistic conditional on the first order statistic being  $v_{(1)}$ .) The bidder estimates how far below his own valuation the next highest valuation is on average, and then submits a bid that is this amount below his own valuation. Thus, from the point of view of the seller, who does not know the winner's valuation  $v_{(1)}$ , the expected price is the expected value of  $B(v_{(1)})$ , which in turn can be shown to be equal to the expected value of  $J(v_{(1)})$ , defined by (1). But, as we have seen already, the expected value of  $J(v_{(1)})$  equals the expected price in an English or second-price auction. Hence, on average, the price reached in a first-price sealed-bid auction is the same as in an English or a second-price auction.

The foregoing argument establishes the Revenue-Equivalence Theorem: *For the benchmark model, each of the English auction, the Dutch auction, the first-price sealed-bid auction, and the second-price sealed-bid auction yields the same price on average* (Vickrey 1961; Armando Ortega-Reichert 1968; Charles Holt 1980; Milton Harris and Artur Raviv 1981a; Myerson 1981a; Riley and Samuelson 1981).

The Revenue-Equivalence Theorem does not imply that the outcomes of the four auction forms are always exactly the

same. In an English or second-price auction, the price exactly equals the valuation of the bidder with the second highest valuation,  $v_{(2)}$ . In a first-price sealed-bid or Dutch auction, the price is the expectation of the second-highest valuation conditional on the winning bidder's own valuation,  $B(v_{(1)})$ . Only by accident, for particular highest and second highest valuations  $v_{(1)}$  and  $v_{(2)}$ , will these two prices be equal. They are, however, equal on average.

Although all four simple auctions yield the same price on average, there is a practical difference between, on the one hand, the English and the second-price auctions and, on the other hand, the first-price and Dutch auctions. In the former case, any bidder can easily decide how high to bid; in an English auction, he remains in the bidding until the price reaches his valuation; while in the second-price auction, he submits a sealed bid equal to his valuation. In the case of a Dutch or a first-price auction, the bidder bids some amount less than his true valuation: Exactly how much less depends upon the probability distribution of the other bidders' valuations and the number of competing bidders, as in equation (5). Finding the Nash-equilibrium bid in the first-price or Dutch auction is a nontrivial computational problem.

The Revenue-Equivalence Theorem is devoid of empirical predictions about which type of auction will be chosen by the seller in any particular set of circumstances. However, as will be seen, when assumptions that underlie the benchmark model are relaxed, particular auction forms emerge as being superior.<sup>13</sup>

<sup>13</sup> The variance of revenue is lower in an English or second-price auction than in a first-price or Dutch auction (Vickrey 1961). Hence, if the seller were risk averse (instead of, as assumed throughout this paper, risk neutral), he would choose one of the former auction forms.

Despite the monopoly-oligopsony nature of the problem, the outcome of the auctions is Pareto efficient: The bidder with the highest valuation receives the item (provided  $J$  is strictly monotonic and the seller values the item less than any bidder). However, as will be seen, if the monopolist is given more instruments, he will in general distort the outcome away from efficiency.

What is the effect of increasing the amount of competition among the bidders? The more bidders there are, the higher on average is the valuation of the second-highest-valuation bidder. Hence: *Increasing the number of bidders increases the revenue on average of the seller* (Holt 1979; Harris and Raviv 1981a). In particular, from equation (2), if  $n = 1$ ,  $B(v_i) = v_i$ : Without the pressure of competition, the sole bidder will bid the lowest possible valuation,  $v_i$ . As the number of bidders increases, the bids, as given by (5), increase.<sup>14</sup> Provided the number of bidders is finite, the winning bidder pays a price less than his own valuation of the item, so that he earns positive economic rent. But if there is perfect competition among the bidders,<sup>15</sup> then all of the gains from trade go to the seller. *As the number of bidders approaches infinity, the price tends to the highest possible valuation* (Holt 1979). This is because, as the number of bidders increases, the second-highest valuation approaches the highest possible valuation.

<sup>14</sup> However, if the bidders must incur a cost in preparing their bids, or if the seller must incur a cost in checking the credentials of the bidders, it need not be the case that expected net price rises with the number of bidders, see respectively Samuelson (1985) and McAfee and McMillan (1987f).

<sup>15</sup> Here and elsewhere we use the term *perfect competition* to describe the case of unboundedly many bidders. Although in practice the number of bidders is of course always finite, the infinite-bidders case can be taken to represent a situation in which there are so many bidders that adding one extra bidder would not noticeably lower the probability of any particular bidder's having the highest valuation.

In addition to the number of bidders, another determinant of the strength of the bidding competition is the variance of the distribution of valuations. The larger is this variance, the larger on average is the difference between the highest valuation and the second highest valuation, and so the larger is the economic rent to the winning bidder. However, an increase in the variance of a distribution, holding the mean constant, usually increases the second highest valuation as well. Hence, for particular distributions of valuations, such as normal and uniform, one can show that an increase in the variance of valuations increases both the average revenue of the seller and the rents of the successful bidders (McAfee and McMillan 1986).

The essence of the auction problem is the unobservability of bidders' valuations. Suppose the seller wishes to learn the bidders' valuations. Can he design the auction so as to induce the bidders directly to reveal their preferences? The following result was independently obtained above: In the second-price sealed-bid auction, each bidder bids his true valuation (Vickrey 1961). This is the benchmark mechanism for this information problem. In this information problem, the seller can average the revenue from any mechanism with the revenue from a second-price auction, and the revenue from any mechanism is less than the revenue from a second-price auction. The seller cannot exploit this information, because he obtains it only after having committed himself to the second-price mechanism.

## VI. Optimal Auctions

The Revenue-Equivalence Theorem compares the expected revenues accruing from each of the commonly used auc-

<sup>16</sup> This is closely related to the idea underlying the Groves mechanism for inducing revelation of preferences for public goods (Theodore Groves and John Ledyard 1977).

tion forms. Given that the monopolist has the power to choose any selling mechanism, a more fundamental question to ask is, What is the best of all possible selling mechanisms from the point of view of the seller?

The tool used to address this question is the Revelation Principle. Use the word *mechanism* to describe any process that takes as inputs the bids and produces as its output the decision as to which bidder receives the item and how much any of the bidders will be required to pay. Each of the auction forms so far described is an example of a mechanism. In a *direct* mechanism, each bidder is asked simply to report his valuation of the item. A mechanism is *incentive compatible* if the mechanism is structured such that each bidder finds it in his interest to report his valuation honestly. Assume the absence of collusion among the bidders. The Revelation Principle asserts the following: *For any mechanism, there is a direct, incentive-compatible mechanism with the same outcome.* Thus, in particular, the optimal mechanism can be mimicked by some direct, incentive-compatible mechanism. (For useful expositions of the Revelation Principle, see Harris and Robert Townsend 1985 and Myerson 1985.)

To exemplify the Revelation Principle, consider the direct, incentive-compatible mechanism that is equivalent to the first-price sealed-bid auction. In the first-price sealed-bid auction, the bidder with the highest valuation  $v$  wins and pays the amount of his bid, which was shown in the last section to be  $B(v)$ . Consider now a direct mechanism, in which the seller simply asks the bidders to report to him their valuations. Usually it will be in the bidders' interests to lie. Suppose, however, the seller announces that the mechanism is the following: The bidder who reports the highest valuation,  $\hat{v}$ , will win the item and be asked to pay  $B(\hat{v})$ . This particular direct mechanism is equivalent

to the first-price sealed-bid auction. Because the bidders in the first-price sealed-bid auction are optimizing when they submit bids of  $B(v)$ , it must be optimal for them to report their valuations honestly, that is,  $\hat{v} = v$ , in this direct mechanism. The mechanism is incentive compatible. Also, as shown earlier, the second-price auction is incentive compatible.

The Revelation Principle achieves honest revelation in the direct mechanism by designing the payoff structure in such a way that it is in the bidders' interests to be honest. In effect, the computations that go on within the mind of any bidder in the nondirect mechanism are shifted to become part of the mechanism in the direct mechanism. Instead of having the bidder compute his own bid in the first-price sealed-bid mechanism, all of the computations are done inside the mechanism in the direct mechanism.

The significance of the Revelation Principle is that it shows that the modeler can limit his search for the optimal mechanism to the class of direct, incentive-compatible mechanisms. The number of possible selling procedures is huge; hence it is useful to be able to restrict attention to one relatively simple class of mechanisms. The Revelation Principle is purely a theoretical technique; few, if any, resource-allocation procedures in practical use are direct, incentive-compatible mechanisms. But using the Revelation Principle does facilitate solving for that resource-allocation mechanism that is optimal subject to the constraints imposed by the asymmetry of information. The optimal direct mechanism is found as the solution to a mathematical programming problem involving two kinds of constraints: first, incentive-compatibility or self-selection constraints, which state that the bidders cannot gain by misrepresenting their valuations; and second, individual-rationality or free-exit constraints, which state that the bidders

would not be better off if they refused to participate.

Returning to the auction model stated in the last section, suppose that the seller himself attaches a value of  $v_0$  to the item being offered for sale. (Because  $v_0$  may be zero, we are not requiring that the seller necessarily has some use for the item.) Continue to assume that the  $J$  function defined in equation (1) is increasing. Applying the Revelation Principle can be shown to yield the following result: *For the benchmark model, the auction that maximizes the expected price is the following characteristics: (a) If  $v_i < v_0$  for all bidders' valuations  $v_i$ , then the seller refuses to sell the item; b) otherwise he offers it to the bidder whose valuation  $v$  is highest at a price equal to  $B(v)$  (Laffont and Maskin 1980; Harris and Raviv 1981a; Milgrom 1985; Myerson 1981; Riley and Samuelson 1981; Engelbrecht-Wiggans 1986; McAfee and McMillan 1987a).*

The first part of this result says that the seller optimally sets a reserve price, not selling the item if all bidders' valuations are too low. Notice that this policy introduces the possibility of an inefficient outcome. Because  $J(v) < v$ , it is possible that the seller keeps the item despite the presence of some bidder with a valuation that is greater than the seller's own valuation. Like the elementary-textbook monopolist, the seller finds it in his interest to distort the outcome away from Pareto optimality.

This description of the optimal auction is in terms of a direct, incentive-compatible auction, with the seller asking the bidders how much they value the item and the bidders responding by honestly reporting their valuations to the seller. To convert back to a more familiar looking mechanism, consider an English auction. As was shown in the last section, the seller expects to earn  $J(v)$  from a winner with value  $v$ . Thus, if the reserve price is not binding, part (b) of the opti-

mal-auction result shows that the optimal auction is equivalent to the English auction. The English-auction equivalent of the reserve price (part (a) of the result) is that the seller sets a reserve price  $r$  which strictly exceeds his own valuation  $v_0$  (namely,  $r = J^{-1}(v_0) > v_0$ ).

To understand why the reserve price increases the average selling price, suppose there is at least one bidder whose valuation  $v$  exceeds the seller's valuation. The reserve price is binding in the English auction only if the second-last bidder drops out before the reserve price is reached. The optimal level of the reserve price is determined by a trade-off. The disadvantage of setting a reserve price, already noted, is that it is possible that the remaining bidder has a valuation that lies between the seller's valuation and the reserve price,  $v_0 < v < r = J^{-1}(v_0)$ . In this case, the monopolist loses the sale even though the bidder would have been willing to pay more than the good is worth to the seller. On the other hand, the advantage of the reserve price is that it is possible that the bidder's valuation exceeds the reserve price.

If the bidder's valuation exceeds the reserve price, the bidder pays at least the reserve price. If the bidder's valuation is less than the reserve price, the bidder pays nothing.

The case of a simple example of a seller with a private value  $v_0$  who sets a reserve price  $r$  and a buyer who never pays more than  $r$ , as he faces no competition. The buyer will pay  $r$  if his value of the good exceeds  $r$ , which occurs with probability  $1 - F(r)$ . Thus, the seller expects to earn:

$$\pi(r) = r[1 - F(r)] + v_0 F(r). \quad (6)$$

Maximization of  $\pi$  with respect to  $r$  yields  $v_0 = J(r)$  and the second order condition that  $J$  is nondecreasing.<sup>17</sup>

<sup>17</sup> A useful way of preserving the second-order-statistic intuition provided earlier is to note that the

Note the simplicity of the formula for the optimal reserve price; in particular, it is independent of the number of bidders. The reason for this is that the seller imposes the reserve price in order to capture some of the informational rents that would otherwise go to the winning bidder; and these rents are equal to  $[1 - F(v)]/f(v)$ , which is independent of the number of bidders. For the case of a uniform distribution of valuations, the optimal reserve price is especially easy to compute: It is the average of the seller's own valuation and the highest possible valuation that a bidder could have.

Because, as was shown in the last section, the four common auction forms are essentially equivalent in the benchmark model, we can conclude as follows: *For the benchmark model, any of the English, Dutch, first-price sealed-bid, and second-price sealed-bid auctions is the optimal selling mechanism provided it is supplemented by the optimally set reserve price. The optimal level of the reserve price for any of these auctions is  $J^{-1}(v_0)$  (Harris and Raviv 1981a; Myerson 1981; Riley and Samuelson 1981).*

This is a powerful result. No restriction has been placed on the types of policies the seller could use. The seller could, for example, have several rounds of bidding, or charge bidders entry fees, or subsidize bidders, or require losing bidders to pay an amount related to their bids, or allow only a limited time for the submission of bids. But none of these more complicated strategies would increase the expected price: The simple auction forms are the best out of the huge set of possible selling mechanisms.

This completes the analysis of the benchmark model. In the next four sections we examine the effects of changing

the assumptions upon which the benchmark model is based.

## VII. Asymmetric Bidders: Price Discrimination

Instead of assuming that all bidders appear the same to the seller and to each other (assumption A3), suppose that the bidders fall into one of two recognizably different classes. (In this section we retain the other assumptions A1, A2, and A4.) Thus, instead of there being a single distribution  $F$  from which the bidders draw their valuations, there are two distributions,  $F_1$  and  $F_2$ ; bidders of type  $i$  draw their valuations independently from the distribution  $F_i$  (with density function  $f_i$ ). For example, bidders at an antiques auction might be classifiable as either dealers or collectors, with the average demand price among dealers differing from that among collectors, or bidders for a government contract might be divided into domestic and foreign firms, with systematic production-cost differences.<sup>15</sup>

The English auction in this asymmetric case operates much as in the benchmark model: The bids rise until the price reaches the second-highest valuation. In particular, the highest-valuation bidder wins, so that the outcome is efficient.

When bidders are asymmetric, the first-price sealed-bid auction yields a different price from the English auction: Revenue equivalence breaks down. While it remains the case that, within a class, higher-valuation individuals bid higher, this is in general not the case across classes. Bidders from different classes perceive themselves to be facing different degrees of bidding competition. If  $n_i$  represents the number of bidders

seller, setting his reserve price optimally, earns the second order statistic of  $[J^{-1}(v_0), v_1, \dots, v_n]$ , where  $J^{-1}(v_0)$  is the valuation (if held by a bidder) that produces a payment to the seller of  $v_0$ .

<sup>15</sup> The results to follow extend to the case of  $m$  classes of bidders for any  $m \leq n$ , where  $n$  is the number of bidders. The discussion here has two classes of bidders solely for ease of exposition.

of type  $i$ , then a type 1 bidder faces  $n_1 - 1$  type 1 bidders and  $n_2$  type 2 bidders, whereas a type 2 bidder faces  $n_1$  type 1 bidders and  $n_2 - 1$  type 2 bidders. Thus, in a first-price sealed-bid auction, a type 1 individual's bidding function, computed analogously to equation (5) above, differs from a type 2 individual's bidding function. A type 1 bidder's estimate of the gap between his own valuation and the second-highest valuation differs from that of a type 2 bidder with the same valuation.

Hence the first-price sealed-bid auction in general yields a different price from the English auction when bidders are asymmetric. Examples have been constructed (by Vickrey 1961; J. H. Griesmer, R. E. Levitan and Shubik 1967; and Maskin and Riley 1983a, 1985) which show that the English auction's expected price can be either higher or lower than the first-price sealed-bid auction's expected price.

Because the bidder with the highest valuation does not necessarily win when the bidders are asymmetric, even with no reserve price, the first-price sealed-bid auction can, unlike the English auction, yield an inefficient outcome.

Neither of these simple auctions is optimal when the bidders are asymmetric. Analogous to the function  $J$  of Section I, define functions  $J_k(v_i^k)$ , where  $v_i^k$  represents the valuation of a bidder of type  $k$ , by

$$J_k(v_i^k) = v_i^k - \frac{[1 - F_k(v_i^k)]}{f_k(v_i^k)}, \quad k = 1, 2. \quad (7)$$

The following theorem is due to Myerson (1981): *In the auction that maximizes the expected selling price, the seller awards the item to the individual with the highest value of  $J_k(v_i^k)$ .* (In addition, the seller sets a different reserve price for each type of bidder, computed in exactly the same way as in Section VI.)

This theorem shows that, when bidders are asymmetric, the optimal auction is discriminatory, in the sense that there is a possibility that one bidder wins despite another bidder's having a higher valuation. This is because asymmetry means that  $F_1 \neq F_2$  so that  $J_1(v) \neq J_2(v)$ . Thus it is possible that, say,  $J_1(v_{(1)}^1) > J_2(v_{(1)}^2)$  even though  $v_{(1)}^2 > v_{(1)}^1$ , so that the winner, with the highest  $J_k(v_i^k)$ , is not necessarily the bidder who values the item the most. This is analogous to second-degree price discrimination in the elementary-textbook monopoly model in that it involves discriminating across bidders with different demands.

Which type of bidder receives preferential treatment? The answer depends upon the relative shapes of the valuation distribution functions  $F_1$  and  $F_2$ . However, one special case is useful in aiding understanding. *If the distributions of valuations are identical except for their means, then the class of bidders with the lower average valuation are favored in the optimal auction.*<sup>19</sup>

(McMillan 1987d). The intuition is that, by giving the low-valuation bidder a higher reserve price, the seller raises the probability of the item being sold to the bidder who values it relatively less. This is a relatively low-cost policy, for the low-valuation bidder is forced to bid higher than they otherwise would, driving up the price on average.<sup>19</sup>

Because the seller's optimal policy leaves a positive probability of the item being awarded to someone other than the bidder who values it the most, the policy is not Pareto efficient. For this policy to be workable, it must be the case, as for

<sup>19</sup> The optimal reserve-price policy described in the previous section can now be seen to be a special instance of this optimal discriminatory policy, with the seller discriminating between himself, as an implicit bidder, and the actual bidders.

the price-discriminating monopolist of elementary economic theory, either that the seller can prevent the successful bidder from reselling the item to some other bidder or that the item being sold is inherently nontransferable. Arbitrage among the bidders, if it were possible, would sabotage any discriminatory selling scheme.

An important application of these results is to government procurement. Governments often favor local suppliers over foreign suppliers. For example, under buy-American legislation, the United States federal government offers a 6 percent price preference for domestic content: If a local firm's bid is no more than 6 percent higher than the lowest foreign bid, the local bid will be accepted. The results just cited show that there are circumstances in which a policy of this type can be optimal: If the foreign firms have on average lower production costs because they have a comparative advantage, then the government minimizes its expected payment by favoring the local firms. Of course, these considerations do not explain the existing policies: In an industry in which the local firms have a comparative advantage, minimizing the government's expected payment requires that the foreign firms be favored, which seems unlikely to occur. Undoubtedly the existing government-procurement preferences were introduced for political reasons and not to increase the amount of bidding competition; however, this analysis shows that it is not appropriate to evaluate such policies using as a benchmark the absence of preferences: An ostensibly nondiscriminatory sealed-bid auction results in ad hoc discrimination when the bidders are asymmetric.

Another instance of a price-discriminating auction occurs when a buyer has a sequence of projects: For example, a government offers a research-and-devel-

opment contract followed by a production contract. The winner of the first auction reveals, by his winning, that he has a cost advantage. Thus *the buyer should discriminate against the incumbent in the second auction* (Richard Luton and McAfee 1986).

### VIII. *Royalties and Incentive Payments*

In the last section we examined an asymmetric-information equivalent of the elementary textbook's concept of price discrimination by market segmentation. Another form of price discrimination discussed in elementary textbooks is multi-part pricing; in this section we examine an asymmetric-information analogue of multi-part pricing.

It has been assumed so far that the seller is able to make payment depend upon only the bids. The bids give the seller some information about how highly the bidders value the item for sale. In many circumstances, however, the seller has, or can obtain, additional information about valuations. In this section, we maintain the assumptions A1, A2, and A3 but relax the assumption A4 that payment can be a function only of bids. We show that it is in the seller's interest to condition the bidders' payments on any additional available information about the winner's valuation. (Of course, if the seller has perfect information on the bidders' valuations, the auction problem is trivial.)

For example, in an auction of oil rights to government-owned land, the government can observe, ex post, how much oil is actually extracted; this provides additional information on the true value of the tract. The payment by the successful bidder equals the amount he bids plus a royalty based on the amount of oil extracted (Ramsey 1980). Publishing rights for books are sometimes auctioned, with payment to the author depending both

on the bid and, via a royalty, on the book's ultimate sales (John Dessauer 1981). For weapons procurement, the U.S. Department of Defense increasingly often uses incentive contracts, which make payment to the contractor depend not only on his bid but also on the production costs he actually incurs (Peter deMayo 1983; McAfee and McMillan 1987e). Incentive contracts are also used in the private sector when a firm procures inputs from another firm.

All of these examples have the following properties. The seller observes ex post some variable  $\hat{v}$  that is an estimate of the winning bidder's true valuation  $v$ . The payment  $p$  to the seller by the winning bidder is a linear function:

$$p = b + r\hat{v}, \quad (8)$$

where  $b$  is the bid and  $r$  is the royalty rate. (In the case of contract bidding, the payment to the successful bidder is  $p = b + \alpha(c - b)$ , where  $c$  is realized production cost and  $\alpha$ , the sharing parameter, is the fraction of any cost overrun or underrun ( $c - b$ ) that the winning bidder is responsible for. In the extreme case of  $\alpha = 1$ , the contract is cost-plus; with  $\alpha = 0$ , the contract is fixed-price.)

Three bidding mechanisms can be used with payment functions of the form (8). First, the seller can set the royalty rate and call for bids  $b$ . Second, the seller can set the fixed payment  $b$  and call for bids on the royalty rate  $r$ . Third, the seller can call for bids on both the fixed payment  $b$  and the royalty rate  $r$  simultaneously. Both the first mechanism and the second mechanism are used by the U.S. government in auctioning offshore oil tracts, with the first being the more commonly used (Walter Mead, Asbjorn Moseidjord, and Philip Sorensen 1984). In what follows, we shall discuss bidding mechanisms of the first type. (See Robert Hansen 1985a, Douglas Reece 1979, and Riley 1986 for analyses of bidding mecha-

nisms of the second type, and Samuelson 1983, 1986b for an analysis of bidding mechanisms of the third type.)

What is the reason for using royalties? *If the distribution of the observed variable  $\hat{v}$  is exogenous, the seller's expected revenue is an increasing function of the royalty rate* (McAfee and McMillan 1986, Riley 1986). The intuition behind this is that an increase in the royalty rate lessens the significance for the bidding of inherent differences in the bidders' valuation. As was noted earlier (in Section V), a decrease in the variance of the bidders' valuations generates more aggressive bidding and therefore a higher expected revenue for the seller. An increase in the royalty rate has a similar effect on the bidding to a decrease in the variance of valuations. The royalty serves to transfer rents from the successful bidder to the seller.

If expected revenue monotonically increases with the royalty rate, why are royalties not always set at 100 percent? One answer is that the distribution of  $\hat{v}$  is not exogenous to the seller's actions after the bidding. The seller may wish to affect the selection of the winner to avoid a moral-hazard problem. For example, the auctioneer of the auction for the winning bidder is the case in each of the three examples above. The amount of oil extracted from a tract is decided by the extractor. Eventually, diminishing returns set in, and the higher the royalty rate, the less oil will be extracted, that is, the lower  $\hat{v}$  will be. The sales of a book vary with the amount of publicity the publisher chooses to give it. The production costs incurred by a contractor in part depend on how much effort he makes to hold costs down. Such moral-hazard considerations must be weighed against the effects on bidding competition in the choice of what royalty rate to set.

When there is moral hazard, the optimal royalty is determined by trade-off. Increasing the royalty rate serves to increase the bidding competition and raise the bids, as already argued. But an increase in the royalty rate reduces the return to the winning bidder on his own actions after the auction: The royalty has the effect of transferring part of the benefit of these actions to the seller. Thus the higher the royalty rate, the less the ex post effort made by the winning bidder; this tends to lower the seller's expected revenue. *With moral hazard, the optimal royalty  $r$  is less than 100 percent* (Engelbrecht-Wiggans 1985; Laffont and Jean Tirole 1985; McAfee and McMillan 1986, 1987c; Michael Riordan and David Sappington 1987. Thus moral hazard results in the seller not making payment fully dependent on his ex post information. The royalty  $r$  is zero if and only if there are infinitely many bidders. This is because, when there are enough bidders that perfect competition prevails, there is no need to use royalties to stimulate bidding competition. Then the contract is used only to address moral hazard; and moral hazard is most effectively addressed when the successful bidder keeps all of any marginal increases in the item's value, that is, when  $r = 0$  in (8).

When the simplicity of the linear payment function (8) means that it is commonly used in practice, in general when there is moral hazard a nonlinear payment function would yield a higher expected revenue for the seller. *With moral hazard, the optimal contract is linear in observed valuation  $\bar{v}$  but nonlinear in the winning firm's bid  $b$*  (Laffont and Tirole 1985; McAfee and McMillan 1987c).

Another reason for not setting the royalty rate at 100 percent comes from the seller's inability to observe bidders' valuation ex ante. For simplicity, assume away moral hazard by assuming perfect ex post observability, so that  $\bar{v} = v$ . The

successful bidder's rent is the difference between his valuation  $v$  and his payment (8). When the royalty  $r$  is 100 percent, this difference is the constant  $b$ ; thus the successful bidder's rent is independent of his valuation. This breaks the link between valuation and bids, so that now the highest bidder is not necessarily the individual who values the item the most. The bids fail to reveal relative valuations (McAfee and McMillan 1986; Samuelson 1986a).

Making payments conditional on ex post observations of valuations serves not only to stimulate bidding competition; it also shifts risk from the bidders to the seller. If the bidders are risk averse while the seller is risk neutral, then some amount of risk shifting is mutually beneficial. *The more risk averse are the bidders relative to the seller, the higher is the optimal royalty rate* (Hayne Leland 1978; McAfee and McMillan 1986; Samuelson 1983, 1986b).

### IX. Risk-Averse Bidders

Auctions generally confront bidders with risk. Typically, a bidder obtains nothing and pays nothing if he loses, and earns positive rents if he wins. Thus if the bidders are risk averse, the extent of their aversion to risk will influence their bidding behavior. In this section we relax assumption A1 and suppose the bidders have von Neumann-Morgenstern utility functions, while maintaining the other assumptions of the benchmark model. We continue to assume that the seller is risk neutral and therefore wishes to maximize his expected earnings.

The seller can do at least as well as in the risk-neutral-bidders case, for if he sells the good using an English auction it remains the case that buyers will remain in the bidding so long as the price is less than their value. Thus, the seller can expect to earn at least as much when

the buyers are risk averse as when they are not. Indeed, the seller can do strictly better, for *with risk-averse bidders, the first-price sealed-bid auction produces a larger expected revenue than the English or second-price auction* (Harris and Raviv 1981a; Holt 1980; Maskin and Riley 1980; Riley and Samuelson 1981). The intuition behind this result is seen by examining the problem facing an agent in the first-price sealed-bid auction. If he loses, he gets nothing, while if he wins, he obtains a positive profit. Thus he is facing risk. By marginally increasing his bid, he lowers his profit if he wins, but increases the probability of this event. By smoothing his utility, he increases his expected utility (up to a point); but this also increases his payment to the seller. Thus the bidders' risk aversion works to the seller's advantage.

The first-price sealed-bid auction is not the optimal auction, however; it fails to maximize the expected revenue of the seller when the bidders are risk averse. Because the seller is risk neutral, there may be gains from trade in risk. The seller is not fully exploiting his comparative advantage in risk bearing when he uses a first-price sealed-bid auction. For example, if the seller makes low bids risky, he might encourage higher bids.

There are two ways in which the seller can impose risk on the bidders: first, the risk of losing; and second, random payments. It can be shown, however, that it is not in the seller's interest to use the second of these instruments. *The seller will not make losing bidders' payments random* (Maskin and Riley 1984b; Steven Matthews 1983). The reason is straightforward. Instead of requiring a risky payment from a loser, the seller could require the payment's certainty equivalent, leaving the probability of winning and the payment upon winning unchanged. Then the payoff to the bidder is unchanged in utility terms. However,

the certainty-equivalent payment exceeds the expected risky payment by the risk premium, a positive number. Thus the seller gains the risk premium; he is better off not making the losers' payments random. Should the seller make the winner's payment random? The foregoing argument does not in general apply to the payment made by the winner, because winning is like receiving an increase in income, which will in general change the degree of risk aversion. The argument does, however, carry over when a bidder's risk aversion does not vary with his income: *If the bidders have constant absolute risk aversion, the payment required of the winning bidder is not random* (Matthews 1983).

The optimal auction is very complicated, in marked contrast to the simplicity of the optimal auction in the case of risk-neutral bidders. However, some broad features can be described. *The optimal auction with risk-averse bidders involves subsidizing high bidders who lose and penalizing low bidders who win* (Riley 1984b; John Moore 1983).

By subsidizing the losers, the seller is imposing positive bidders' payments on the losers and negative payments on the winners. Thus the seller is imposing risk on the bidders. In one case, however, the seller provides full insurance only for the highest possible bid (Maskin and Riley 1984b). Thus bidders prefer to win than to lose, despite the subsidies to some of the losers. Finally, in the case of constant absolute risk aversion, payment by the winner and the probability of winning are nondecreasing functions of the winner's valuation of the item (Matthews 1983). The fact that the bidders' certainty-equivalent payment decreases as valuation rises provides high bidders with more insurance than low bidders. Thus the seller rewards high

bids by means of insurance, which is costless for him to provide because of his risk neutrality. Because the seller does not offer full insurance, the bidders prefer winning to losing; moreover, an increase in bid does not decrease the bidder's probability of winning. The seller compensates for his payments to high, losing bidders by requiring a large payment from the winning bidder.

Because the optimal auction with risk averse bidders is so complicated, requiring payments from some losing bidders and subsidies of others, it is unlikely to arise in practice. However, if the risk aversion is not very strong, the optimal auction is approximated by a sealed-bid auction with a bidding fee that is a decreasing function of the bid (Matthews 1983). Bidding fees are not uncommon in contract bidding, although they do not depend on the bid. However, insofar as bidders with high but losing bids can be rewarded on other contracts, perhaps with favorable treatment, it is possible that the optimal auction could be approximated in practice.

Consider now another instrument that becomes useful to the seller when the bidders are risk averse. A standard assumption in auction theory is that each bidder knows exactly how many other bidders he is competing with. When bidders are risk averse, this is a nontrivial assumption, for the bidders behave differently when they have this knowledge than when they do not. This is a consequence of the fact that the seller rationally has a different expectation about the number of bidders than does any of the bidders, because the bidder conditions his probabilities on his knowledge that he himself is one of the bidders; it follows that, with identical priors, any bidder always expects there to be more bidders than the seller. *Under constant or decreasing absolute risk aversion, in a first-price sealed-bid auction the expected sell-*

*ing price is strictly higher when the bidders do not know how many other bidders there are than when they do know this* (Matthews 1987; McAfee and McMillan 1987a). (Here expectations are taken over the number of bidders as well as their valuations.) It follows from this result that, if the seller can somehow organize the auction in such a way as to leave each bidder ignorant about the number of bidders, then he should do so. In some cases of government-contract bidding, the government agency has a policy of concealing information about how many firms it has invited to submit bids. The foregoing result provides some justification for such a policy: Concealing the number of bidders has the effect of making the bidding more competitive.<sup>20</sup>

### X. *Correlated Values*

In many auctions, the uncertainty about each bidder's valuation of the item being sold does not result from inherent differences in the bidders' tastes, as has so far been assumed. Instead, it arises because each bidder, having access to different information, has a different estimate of the value of the item. In this section, we maintain assumptions A1, A3, and A4. We relax assumption A2, the independent-private-values assumption, and allow interactions among the different bidders' valuations.

Consider first the extreme case of the common-value auction, in which the bidders guess about the unique true value of the item. When the item being bid for has a common value, the phenomenon dramatically named the "winner's curse" can arise. Each bidder in sealed-bid auction makes his own estimate of

<sup>20</sup> The effects of bidders' having different degrees of risk aversion were investigated by James Cox, Vernon Smith, and James Walker (1982), who derived equilibrium bidding functions for some particular auctions for the case of constant relative risk aversion.

the true value of the item. The bidder who wins is the bidder who makes the highest estimate. Thus there is a sense in which winning conveys bad news to the winner, because it means that everyone else estimated the item's value to be less. The winner's curse has been noted in the book-publishing industry. One observer, commenting on the high prices fetched in the auctioning of manuscripts among publishers, said: "The problem is, simply, that most of the auctioned books are not earning their advances. In fact, very often such books have turned out to be dismal failures whose value was more perceived than real" (Dessauer 1981). The winner's curse has also been claimed to exist in auctions of offshore oil rights (E. C. Capen, R. V. Clapp, and W. M. Campbell 1971), in the market for baseball players (James Cassing and Richard Douglas 1980), and in the bidding for contracts that have a common element of technological uncertainty (James Quirk and Katsuaki Terasawa 1984).

Statements about the winner's curse such as that quoted come close to asserting that bidders are repeatedly surprised by the outcomes of auctions, which would violate basic notions of rationality. (James Cox and Mark Isaac (1984) pursued this straw man.) A more reasonable interpretation of the winner's curse is that sophisticated bidders, when deciding their bidding strategies, take into account the fact that winning reveals to the winner that his estimate of the item's value was the highest estimate; as a result, they bid more cautiously than if they adopted naive strategies. The basis for such sophisticated bidding strategies is the following result in probability theory. Suppose the  $i$ th bidder's information about the item's true value  $v$  can be represented by a number  $x_i$ , such that a bigger value of  $x_i$  implies a bigger true value  $v$ . Then

$$E(v|x_i) \geq E(v|x_i, x_i > x_j \text{ for all } j \neq i) \quad (9)$$

(Milgrom 1979b, pp. 60–63; 1981a). The left side of this inequality shows the bidder's expectation about the item's value before the bidding; the right side shows his expectation after he knows that he has won. Thus the mere knowledge that he has won will cause a naive bidder to revise downward his estimate of the item's true worth.

The rational bidder in a common-value sealed-bid auction avoids becoming a victim of the winner's curse by presuming that his own estimate of the item's value is higher than any other bidder's; that is, by presuming that he is going to be the winner (James Smith 1981). He then sets his bid equal to what he estimates to be the second-highest perceived valuation given that all the other bidders are making the same presumption. There is no cost to making this presumption when it is wrong, because losing bidders pay nothing (Milgrom and Weber 1982a).

It is often pointed out that the process of price formation in competitive bidding is criticized by Hayek in that one of the requirements of the process is that the bidders convey information about their private information to a buyer or a seller. This is a commodity that is not easily transferred. The process of price formation in competitive bidding have such information efficiencies? In the common-value model, the bidders lack complete information about the item's true value; each bidder has different partial information. However, even though no single bidder has perfect information, it can be shown that, if there is perfect competition in the bidding, the selling price reflects all of the bidders' private information. If information is sufficiently dispersed among the bidders then the selling price converges to the item's true value  $v$  as the number of bidders becomes arbitrarily

large (Milgrom 1979a, 1979b; Wilson 1977). Thus the selling price conveys information about the item's true value. With perfect competition, the price is equal to the true value even though no individual in the economy knows what this true value is and no communication among the bidders takes place.<sup>21</sup>

Consider now the more general model, due to Milgrom and Weber (1982a), that allows correlations among the bidders' valuations, and of which the common-value model is a special case. Recall from Section IV that bidders' valuations are said to be affiliated if the fact that one bidder perceives the item's value to be high makes it likely that other bidders also perceive the value to be high. The essential difference between, on the one hand, the English auction and, on the other hand, the first-price sealed-bid, second-price, and Dutch auctions is that the process of bidding in the English auction conveys information to the bidders: The remaining bidders observe the prices at which the other bidders drop out of the bidding. It was shown for the independent-private-values auction that this extra information does not on average change the outcome, in the sense that the expected price reached is the same for each type of auction. When bidders' valuations are affiliated, in contrast, the bids in the English auction have the effect of partially making public each bidders' private information about the item's true value, thus lessening the effect of the winner's curse. As a result: *When bidders' valuations are affiliated, the English auction yields a higher expected revenue than the first-price sealed-bid*

*auction, the second-price sealed-bid auction, or the Dutch auction* (Milgrom and Weber 1982a). In addition, the other three auction forms can be ranked. *With affiliated valuations, the second-price sealed-bid auction yields a higher expected revenue than the first-price sealed-bid auction, which yields the same revenue as the Dutch auction* (Milgrom and Weber 1982a).

Sometimes the seller has independent information correlated with the item's value to any of the bidders. (For example, the government can do its own geological surveys before offering mineral rights for sale; the seller of a painting can obtain an expert's appraisal.) Should the seller conceal this information, or should he reveal it? *The seller can increase his expected revenue by having a policy of publicizing any information he has about the item's true value* (Milgrom and Weber 1982a). This is because the new information tends to increase the value estimates of those bidders who perceive the item's true value to be relatively low, causing them to bid more aggressively.

How important is the privacy of any bidder's information? *If one bidder's information is available to another bidder, his expected surplus is zero* (Engelbrecht-Wiggans, Milgrom, and Weber 1983; Milgrom 1981b; Milgrom and Weber 1982a). This is a striking result; it implies that it is more important to a bidder that his information be private than that it be precise.

It is in the seller's interest in a common-value auction to impose a reserve price that is strictly above his own valuation of the item. In contrast to the independent-private-values case, *the reserve price in a common-value auction varies with the type of auction and with the number of bidders*; usually, but not always, it increases with the number of bidders (Milgrom and Weber 1982a; Marc Robinson 1984). This is because,

<sup>21</sup> Note that this result, which takes as given the diversity of the bidders' information, ignores the possibility that bidders might be able, at some cost to themselves, to obtain extra information relating to the item's true value. On information acquisition in auctions, see Engelbrecht-Wiggans, Milgrom, and Weber (1983), Tom Lee (1982, 1985), Matthews (1984a), Milgrom (1981b, 1985), and Milgrom and Weber (1982b).

as implied by the winner's curse effects embodied in condition (9), any bidder's ex ante valuation of winning depends upon the auction form and the number of bidders. For example, the working of the English auction provides some information about others' valuations, mitigating winner's curse effects. The more bidders there are, the more heavily the bidder, following (9), discounts his private information.

What is the optimal auction when bidders' valuations are correlated? Consider the special case in which bidders have private valuations that are not statistically independent of each other. Jacques Crémer and Richard McLean (1985a, 1985b) have provided a method for the seller to extract all of the gains from trade from the buyer. This requires a certain type of correlation among the bidders' valuations; it will not work with pure independent values. In addition, it is assumed that only a finite number of valuations are possible; the case of continuously distributed values is not considered. The mechanism design may be understood as follows. Represent by  $\pi(v_i|v^{-i})$  the probability that the  $i$ th bidder's value is  $v_i$ , given the vector of other bidders' values  $v^{-i}$ . The seller offers each bidder a lottery plus participation in a second-price auction. The trick is to design the lottery so that the lottery's expected value for the  $i$ th agent is precisely the expected value the agent receives from the auction, and the outcome of the lottery depends only on  $v^{-i}$  and not on  $v_i$ . This ensures that the agents continue to bid honestly in the second-price auction, because a change in bid by bidder  $i$  does not affect his lottery. The condition that permits such a lottery to be designed is that  $v_i$  is, in a probabilistic sense, recoverable from  $v^{-i}$ ; more precisely, the matrix  $\pi(v_i|v^{-i})$  is of full rank (equal to the number of possible values  $v_i$  can take on). Thus, the Crémer-McLean result asserts that, if the distribution of each

agent's valuation is altered sufficiently by changes in the other agents' valuations, the full surplus can be extracted by the seller.<sup>22</sup>

## XI. Further Topics

Each of the four main assumptions underlying the benchmark model has now been relaxed. This section more briefly considers some additional questions.

### 1. Variable Supply and Capacity Constraints

In the models considered so far, only a single unit of an item is being sold. The opposite polar case occurs when the monopolist produces under constant returns to scale and can freely vary the amount offered for sale. What then is the optimal selling scheme when, as before, the seller does not know the buyers' tastes?

Suppose for simplicity that each buyer wishes to buy at most one unit of the commodity. Each buyer's valuation of the single unit is drawn independently from a distribution with density  $f(r)$  and mean  $\mu$ . Let  $c$  be the marginal cost. With constant returns to scale, the optimal selling scheme is defined by

$$c = r - \frac{1 - F(r)}{f(r)} \quad (10)$$

(Harris and Raviv 1981b; Matthews 1983.) (To obtain (10), note that the probability that any one customer buys at price  $r$  is  $1 - F(r)$ , so that the expected

<sup>22</sup> Because the second-price auction is a dominant-strategy auction, the Crémer-McLean auction/lottery also has a dominant equilibrium (although participation is not necessarily a dominant strategy). With slightly weaker assumptions on  $\pi$ , a Bayes-Nash equilibrium auction that extracts all of the surplus can be constructed. Note also that the optimal-auction result of Myerson (1981) allows a limited kind of affiliation among valuations.

profit per potential buyer is  $[1 - F(r)](r - c)$ . This is maximized when (10) is satisfied.) The posted price when capacity is unlimited is exactly the same as the reserve price when only one unit is to be sold (as in Section VI).

Between the cases of single unit and unlimited capacity is the case in which a fixed quantity is put up for sale and buyers may bid for some portion of the available units. One example of such an auction is the weekly United States Treasury bill auction (Smith 1967). Another example is the New Zealand government's auctioning of import quotas (Pickford 1985).

Two kinds of sealed-bid auctions are used to sell multiple units. Bidders submit bids that consist of both a price and a desired number of units of the commodity. Suppose enough units are available that the  $h$  highest bidders can be awarded the item. In the discriminatory auction, each of these  $h$  bidders pays the amount he bid. In the uniform-price auction, each successful bidder pays a price equal to the highest unsuccessful bid, the  $(h + 1)$ st bid. Clearly the former corresponds, in the single-unit case, to the first-price auction, and the latter corresponds to the second-price auction.

Results similar to the single-unit case can be established for multiple-unit auctions. For example, for the benchmark model, the discriminatory auction yields on average the same revenue as the uniform-price auction. Risk aversion of bidders results in the discriminatory auction yielding higher average revenue than the uniform-price auction, while in the common-value case this ordering is reversed (Weber 1983).<sup>23</sup>

<sup>23</sup> For further analysis of auctions of multiple units of a commodity, see Engelbrecht-Wiggans and Weber (1979), Harris and Raviv (1981a, 1981b), Donald Hausch (1986), Maskin and Riley (1983b, 1984a), Matthews (1983, forthcoming), McAfee, McMillan and Whinston (1987), Milgrom (1985), Thomas Palfrey (1980, 1983), Vernon Smith (1967), Weber (1983), and Wilson (1979).

## 2. Collusion Among the Bidders

It has been assumed so far that the bidders act noncooperatively: They do not coordinate their bids. This assumption may not be appropriate in some circumstances, especially when the same bidders compete with each other over many successive auctions. Collusion may consist of either explicit agreements about which bidder will be allowed to win any particular auction, or implicit understandings that restraint will be exercised in bidding.

The familiar analysis of repeated oligopoly games can be applied to repeated auctions. In an infinitely repeated game, a collusive outcome can be maintained as a noncooperative equilibrium if each of the oligopolists adopts a strategy of threatening to retaliate to any deviation from the collusive arrangement by reverting to noncooperative behavior in future periods. This is the Folk Theorem of repeated games (see Robert Aumann 1981; in an incomplete-information setting, see Dilip Abreu, David Pearce, and Ennio Stacchetti 1986). Anecdotal evidence suggests the empirical relevance of the repeated-game argument. It has been observed that collusion in antique and artwork auctions is enforced by retaliatory strategies: the response to a defection by a cartel (or "ring") member is that "vindictive competition leads to crazy prices" (Jeremy Cooper 1977, pp. 37-38).<sup>24</sup>

For retaliatory strategies to be workable, it must be possible for the bidders to infer the other bidders' past actions. As George Stigler (1964, p. 48) remarked

<sup>24</sup> Milgrom (1986) showed that there is a sense in which repeated English auctions are more susceptible to collusion than repeated first-price sealed-bid auctions. Robinson (1985) showed that an implicitly collusive outcome could be reached as a Nash equilibrium in a single English auction. However, his analysis assumes that each bidder knows his rivals' valuations, which assumes away much of the auction problem.

of government procurement auctions, "the system of sealed bids, publicly opened with full identification of each bidder's price and specifications, is the ideal instrument for the detection of price cutting . . . collusion will always be more effective against buyers who report correctly and fully the prices tendered to them."<sup>25</sup> This may explain the tendency for private-sector firms to use closed negotiations rather than formal auctions for procurement.

How does a cartel decide which member is to receive the item? In English auctions, a common method in practice is for one member arbitrarily to be assigned to bid for the item without competition from his fellow cartel members. Afterward, the item is reaucted among the cartel members. Such behavior occurs in auctions of antiques, fish, timber, industrial machinery, and wool (Cassady 1967, Ch. 13; Cooper 1977, pp. 35-38; F. H. Gruen 1960). The cartel member who values the item the most will win the bidding in the illicit auction at a price equal to the second highest valuation among cartel members. The cartel shares among its members a sum of money equal to the difference between the price reached in the cartel's own auction and the price reached in the original auction.

What should a seller do if he believes he faces a buyers' cartel? According to Cassady (1967, pp. 228-30), reserve prices are commonly used to counter the activities of cartels. To understand this practice, assume for simplicity that all  $n$  bidders belong to the cartel, and that assumptions A1, A2, A3, and A4 of the benchmark model are satisfied. The cartel not only reduces to one of the effective number of bidders; it also changes the effective distribution of valuations. Assume that (perhaps by the reaucting

process described above) the cartel can ensure that the member who values the item the most ultimately gets it. The relevant distribution for the seller faced with the cartel is the distribution of the maximum of  $n$  valuations, each drawn from the distribution  $F(x)$ ; this distribution of maxima is  $F^n(x)$ , with density  $nF^{n-1}(x)f(x)$ . Thus an argument the same as that in Section VI but for this density yields: *The optimal anticartel reserve price  $r$  satisfies*

$$r_0 = r - \frac{1 - F^n(r)}{nF^{n-1}(r)f(r)}, \quad (11)$$

where  $r_0$  is the seller's own valuation (Daniel Graham and Robert Marshall 1984, 1985; Robinson 1984). This implies that the anticartel reserve price increases with the number of cartel members. Also, the anticartel reserve price is higher than the optimal reserve price in the absence of collusion.

### 3. Double Auctions

It was assumed in the foregoing analysis that there was only one seller and that his valuation of the item was independent of all of the bids. If, instead, there are several sellers, each with his own valuation, and if the buyers, drawn independently from some distribution, also have valuations, then there are several possible double auction mechanisms.

In a sealed-bid double auction, each seller and each buyer submit bids, buyers for how much they are willing to pay and sellers for the price at which they are willing to sell. Ranking the buyers' bids from highest to lowest produces a bid-demand function which is a step function. Similarly, ranking the sellers' bids produces a supply step function. The intersection of demand and supply generally gives a quantity and an interval of prices. This is the quantity exchanged; the price is chosen from the interval according to some arbitrary rule. This resembles the

<sup>25</sup> On the various methods by which bidders for government contracts achieve collusion, see Organization for Economic Cooperation and Development (1976).

standard Walrasian model in which agents report their demand and supply curves to the auctioneer. However, the choice of bids reflects individuals' strategic attempts to manipulate the selling price, so that the quantity and price interval reached are not necessarily those of the competitive equilibrium.

Few results on the double auction exist, because of the difficulties of modeling strategic behavior on both sides of the market. The main result is an efficiency result concerning double auctions with sealed bids. *If there are sufficiently many buyers and sellers, then there is no other trading mechanism that would increase some traders' expected gains from trade without lowering other traders' expected gains from trade* (Wilson 1985). That is, the sealed-bid double auction would survive any attempt to get the traders to agree unanimously to change the trading institution.<sup>26</sup>

The oral double auction, with the bids and offers openly called, is still more difficult to model because the process takes place over time and agents do not know what prices will be available if they wait instead of trading now. For some analysis of the oral double auction, see David Easley and Ledyard (1982), Daniel Friedman (1984), and Wilson (1986b).

## XII. Empirical Studies of Auctions

What is the empirical content of auction theory? There are far fewer empirical than theoretical studies of auctions. Also, with the exception of some studies of common-value auctions (using mineral-rights bidding data), the existing empirical studies make little use of modern auction theory. As a result (again, except

in the mineral-rights studies), only the more commonsense propositions have been tested.

The independent-private-values model predicts revenue equivalence: Each of the four simple auctions yields the same price on average (Section V above). Unfortunately, this prediction is sensitive to changes in the underlying assumptions, making difficult the task of empirically testing it. If the bidders have independent private valuations but are risk averse, then the first-price sealed-bid auction yields a higher price on average than any of the other simple auctions (Section IX). This ranking is reversed if the bidders are risk neutral but have correlated valuations; then the English auction yields the highest price (Section X). If there are observable differences among the bidders' valuations, the ranking is indeterminate (Section VII). Thus any empirical test of revenue equivalence should carefully control for risk aversion of the bidders, correlations among their valuations, and asymmetries among the bidders.

Risk aversion is likely to be important when the item being sold is very valuable so that the bids are large relative to any bidder's assets. Examples of valuable items that are auctioned include mineral rights, government contracts, and artwork; however, artwork, mineral rights, and, in some cases, government contracts also have common-value aspects. Government-procurement auctions and mineral-rights auctions are usually sealed-bid; this may be a consequence of the result that risk aversion makes the sealed-bid auction preferable to the English auction. On the other hand, artwork is usually, but not always, sold by English auction, even though risk aversion is likely to be significant in at least some cases. Presumably in the case of artwork the correlations among bidders' valuations outweigh the risk-aversion effects

<sup>26</sup> Also, Wilson (1986a) showed that, for the case of equal numbers of buyers and sellers with valuations distributed uniformly, the double auction satisfies the stronger criterion of ex ante efficiency: It maximizes the expected gains from trade.

in the bidding. Low-value items like agricultural produce, for which risk-aversion effects are likely to be negligible, are usually sold by English auction.

The U.S. Forest Service has used both first-price sealed-bid auctions and English auctions to sell contracts for harvesting timber. This provides an opportunity for testing the Revenue-Equivalence Theorem: Do the two methods yield the same price on average? Walter Mead (1967) ran ordinary-least-squares regressions with, as the dependent variable, the logarithm of the ratio of bid price to appraised price and, as the independent variables, a dummy variable for the auction method and the logarithm of the quantity of timber for sale. The conclusion was that the sealed-bid auctions had yielded significantly higher revenue than the English auctions. Further unpublished regressions by Mead and coauthors (summarized by Hansen 1985b) supported this conclusion, finding that the sealed-bid auctions yielded about 10 percent more revenue. These results have been questioned by Hansen (1985b, 1986), who noted a selection bias caused by the way the Forest Service chose which auction to use.<sup>27</sup> (Evidently the Forest Service does not believe in revenue equivalence.) Some unobserved variables, such as the bidders' timber inventories, affected the choice of auction method. But to the extent that these variables also affected the size of the bids, ordinary-least-squares estimates are biased. After correcting for this selection bias by using a simultaneous-equations model, Hansen found that, although the sealed-bid auctions yielded slightly higher prices than the English auctions, the difference was statistically insignificant. (With high bids averaging \$130, the expected difference in revenue was be-

tween \$1 and \$6, with a standard error of \$5.) Revenue equivalence therefore cannot be rejected.

A question not addressed in these timber-bidding studies is, How appropriate is the independent-private-values assumption in this application? In other words, on a priori grounds, should we expect revenue equivalence to hold in this set of data? Because different bidders have different inventories of timber on hand and different stocks of equipment for harvesting timber, it is reasonable to suppose that there are inherent differences among the bidders' valuations at any particular sale. But because the timber is eventually to be resold at the as yet unknown market price, there might be some correlation among the bidders' valuations. To the extent that the second effect is empirically significant, the independent-private-values assumption breaks down and the appropriate model is the affiliation model of Milgrom and Weber (1982a) (see Section IV). We are now left with a puzzle. Contrary to the empirical results just presented, the affiliation model predicts that the correlation among valuations should reduce the high-bid bias. The puzzle could be resolved by showing that the bias is due to risk aversion. But this remains an open question. Given the sense in which the Revenue-Equivalence Theorem holds under these assumptions, this theorem cannot be meaningfully tested until some way is found to test for independent private values against affiliated values.

A further reason, distinct from correlation of valuations, why revenue equivalence can break down is the existence of systematic differences among bidders' valuations that are observable by all of the bidders (as discussed in Section VII). For timber-rights bidding, Ronald Johnson (1979) and Hansen (1986) suggested that such variables as the required amount of road building or the required

<sup>27</sup> For the institutional details of the auction-selected process, see Hansen (1986, pp. 129-31).

harvest rate might cause harvesting costs and therefore valuations to differ in observable ways among the bidders. Johnson separated the data into auctions with symmetric bidders and auctions with asymmetric bidders by an ad hoc method: He hypothesized that asymmetry is more likely the larger the amount of road construction required, and took as his cutoff between symmetry and asymmetry sales involving \$20,000 worth of road building. He ran ordinary-least-squares regressions with, as dependent variable, the price, and as independent variables, a dummy representing the auction form as well as all of the components of the Forest Service's appraisal. For the symmetric auctions, consistent with the Revenue-Equivalence Theorem, there was no significant difference in price between the English auctions and the sealed-bid auctions. For the asymmetric case, there was a significant difference: The sealed-bid auctions yielded higher prices. Contrary to Johnson's interpretation, however, this does not test the theory, because in the asymmetric case there is only an ambiguous result: Either auction form can yield the higher price (see Section VII).<sup>28</sup>

Another theoretical result on asymmetric auctions is that, in the absence of a reserve price, an English auction always yields an efficient outcome (the bidder with the highest valuation wins), whereas a sealed-bid auction may yield an inefficient outcome (Section VII). When the seller is the government (as in the timber-rights auctions), this provides a reason for using English auctions that is distinct from issues of revenue

raising. Johnson (1979) tested this proposition by noting that it implies that, if resale is allowed, it should occur only after a sealed-bid auction and not after an English auction. In Johnson's data, with a total of 379 sales, all seven of the resales that occurred followed sealed-bid auctions, corroborating the theory.

In value terms, one of the world's largest users of auctions is the U.S. Treasury in its selling of securities. This is an instance of a multiple-unit auction: Both the discriminatory auction (in which each successful bidder pays the amount he bid) and the uniform-price auction (in which all pay a price equal to the lowest accepted bid) have been used to sell Treasury bills. Because this is a common-value setting, theory predicts that the uniform-price auction, which is similar to the second-price auction, yields more revenue than the discriminatory auction, which corresponds to the first-price auction (Sections X and XI.1). Charles Baker (1976) summarized some Treasury studies that attempted to compare the performance of the two auction forms. Unfortunately the data are not strictly comparable: Uniform-price auctions were used to sell long-term bonds, whereas discriminatory auctions were used to sell short-term and medium-term bonds. Because of this, the empirical conclusions can only be tentative; however, they do support the theory, in that the uniform-price auctions seemed to generate the higher revenue.

An unsurprising prediction of auction theory is that, other things being equal, a bidder with a higher valuation will submit a higher bid (or, in the case of contract bidding, a firm with lower costs submits a lower bid). In their study of bidding for construction contracts for San Francisco's Bay Area Rapid Transit system, Kenneth Gaver and Jerold Zimmerman (1977) estimated a model with, as the dependent variable, the level of each

<sup>28</sup> Maskin and Riley (1985) conjectured that, in an asymmetric auction, a sealed-bid auction yields a higher price than an English auction if the bidders have distributions of valuations with roughly the same shape but different supports. While it remains to be shown that this is valid in general, it provides a potential explanation for Johnson's finding.

firm's bid for each contract, and, among the independent variables, various proxies for costs as well as the number of bidders. They found that bids were higher (a) the more BART work the bidder had in process; (b) the less time the contractor had to complete the project; and (c) the smaller the firm. Of these three variables, (a) reflects the bidder's opportunity cost, and (b) and (c) affect production costs if it is presumed respectively that faster production is more costly and that there are economies of scale.

Another prediction is that competition matters: The winning bid increases as the number of bidders increases (or, in the case of contract bidding, the winning bid falls). In their study of contract bidding, Caver and Zimmermann (1977) found that the price fell as the number of bidders increased. One of their regressions, for example, implied that bids decline by about 2 percent when the number of bidders increases by one. Similarly, Lance Brauman, Douglas Klein, and Leonard Weiss (1984), using data from auctions of tax-exempt bonds, government-owned timber, and offshore oil rights, and attempting to control for the inherent value of the item being sold, found the effect of the number of bidders on the price to be statistically significant. Large gains can be obtained by introducing bidding competition where none formerly existed: Larry Yuseph (1976) found price differences averaging 50 percent between identical military contracts let successively on a sole-source basis and under competitive bidding. A cartel reduces the effective number of bidders: In a study of collusion among bidders for North Carolina highway-construction contracts, Jonathan Feinstein, Michael Block, and Frederick Nold (1985) found that the cartel not only significantly raised the bids but also reduced the variance of the bids.

While there appear to be no econometric analyses of the use of reserve prices (Section VI), there is some informal evidence. Practice does not seem to be in accord with the theoretical result that it is in a seller's interest to announce a reserve price. In practice, reserve prices are often not used; when they are used, their existence is often not announced, and even when their existence is announced, the seller usually keeps the level of the reserve price secret (Cassady 1967, pp. 226-27). Thus there appears to be a discrepancy between theory and practice.<sup>29</sup> Consistent with the prediction that the reserve price will be set at a level that exceeds the seller's own valuation, in the Netherlands cut flowers not attaining the reserve price are destroyed, indicating that their value to the seller is zero despite being given a positive reserve price (Cassady 1967, p. 230).

Studies of the bidding for offshore oil rights have focused on the existence and consequences of the winner's curse (Section X).<sup>30</sup> The first of these studies, by Capen, Clapp claimed that v average less t turn on their surprisingly l tio of highest as 100 and typ indicating much un amount of oil beneath any tract. They attributed the low rates of return to the fact that "the winner tends to be the

<sup>29</sup>This need not, however, be inconsistent with theory. One explanation for the seller's not imposing a reserve price is that he lacks the necessary bargaining power, that is, the ability to precommit himself to his selling policy (see Milgrom 1986).

<sup>30</sup>The auctioning of mineral rights to government-owned land is almost unique to the United States; governments in other countries usually allocate mineral rights to firms by discretionary procedures (Ramsey 1980, pp. 56-62). It is noteworthy, however, that in 1982 the People's Republic of China began auctioning offshore exploration contracts (*New York Times*, March 23, 1985).

player who most overestimates the true tract value" (p. 643). The conclusion of Capen, Clapp, and Campbell about low rates of return was based on casual empiricism. Subsequent, more careful studies have overturned this conclusion. Mead, Moseidjord, and Sorensen (1984) estimated after-tax internal rates of return of outer-continental shelf lessees to be roughly the same as the average rate of return on investments in the U.S. manufacturing industry. Kenneth Hendricks, Robert Porter, and Paul Gertler (1986) similarly found reasonable rates of return. Hendricks, Porter, and Gertler also discussed the practical importance of two aspects neglected by the theorists. Often, several tracts are auctioned simultaneously, so that a bidder's decision on how to bid on one tract may be influenced by his bids on other tracts. Moreover, as also emphasized by Otis Gilley and Gordon Karels (1981), there is a prior decision on whether to bid on a particular tract; only some of the potential bidders actually bid for any one tract. There tend to be more bidders for tracts that are perceived to be more valuable. Thus estimating the effect of competition by simply regressing price on the number of bidders (as discussed above) can be misleading.

Gilley and Karels (1981), after correcting for the sample-selection bias arising from the bidders' participation decisions, found that individual bids in an oil-rights auction decreased as the numbers of bidders increased. This apparently paradoxical result can be explained as resulting from the bidders' rationally taking account of the winner's curse effect of condition (9) above. Recall that a rational bidder in a common-value auction bases his bid not only on his own estimate of the item's worth, but also on the presumption that he has the highest estimate. The more bidders there are, the more marked is the second of these ef-

fects. This can mean that individual bids decline as the number of bidders rises. Hendricks, Porter, and Gertler (1986), generalizing the Gilley-Karels model by allowing nonlinear bidding functions, found that bids initially increased and then decreased as the number of bidders increased. (Note that these results are not inconsistent with the result that the winning bid increases with the number of bidders, for the more bidders there are, the more likely it is that some bidder perceives the item's value to be high.) More accurate information about the item's true value mitigates the effect of the winner's curse in causing the bidders to be cautious: Gilley and Karels found that the smaller the variance in the initial estimates of the tract's value, the higher the bids. With millions of dollars at stake, the oil firms evidently avoid falling victim to the winner's curse.

The results of Milgrom and Weber (1982b) (Section X above) create a presumption that having private information raises a bidder's profits. A test of this prediction is provided by the study of oil-rights bidding by Mead, Moseidjord, and Sorenson (1984) (although the study is not explicitly based on the Milgrom-Weber model). Two types of leases exist: drainage tracts (close to an existing well) and wildcat tracts (in an area for which no drilling data exist). For drainage tracts, denote by "neighbor" a bidder who has information because he has already drilled nearby wells. Mead, Moseidjord, and Sorenson estimated that there were gains from superior information. Drainage leases earned a higher after-tax internal rate of return than wildcat leases, and, among drainage leases, neighbors earned a higher rate of return than non-neighbors. Similar results were obtained by Hendricks, Porter, and Bryan Boudreau (1987). Theory suggests that the gains from superior information are lessened if a rival also has superior

information (Milgrom and Weber 1982a). Mead, Moseidjord, and Sorenson, however, found an unusually high rate of return when a neighbor competed with a neighbor (although a very small sample underlay this estimate).<sup>31</sup>

More empirical work is needed, both because several testable predictions remain untested and because usable sets of microlevel data have not yet been exploited. To what extent do royalties serve to extract surplus from the bidders, as discussed in Section VIII? Mineral-rights auctions, which sometimes use royalties and sometimes do not, might provide data for estimating this. Mineral-rights data might also be used to address the question: When reserve prices are used, are they set at a level that approximates the optimum (Sections VI, X)? Government contracting provides an underexploited source of data on bidding; questions such as the effect of incentive contracts as a rent-extracting device (Section VIII) and the effects on the bids of discriminating against foreign bidders (Section VII) could be examined. What types of auction are actually used when the bidders are markedly risk averse (Section IX)? In privatizing publicly owned firms, governments sometimes have auctioned the whole firm and sometimes have sold shares at preset prices. Which method has yielded more revenue for the government? Different auction forms are used in apparently similar circumstances; for example, at various times and in various places, tobacco has been sold by English, Dutch, and first-price

sealed-bid auctions. Can each use be explained, or is this merely due to revenue equivalence, which means that the seller is indifferent about the choice of auction form?

Another source of empirical evidence on bidding behavior is laboratory experiments. There is a large and growing literature on experiments with auctions, which is not surveyed here for space reasons. See Charles Plott (1982) and Vernon Smith (1982) for general surveys of experimental economics, including some discussion of auction experiments; and, for representative papers, see Cox, Smith and Walker (1984) (on independent-private-value auctions) and Max Bazerman and Samuelson (1983) (on common-value auctions).

### XIII. An Agenda for Research

Many questions about the working of the various auction institutions remain unanswered by the theory.

Much of the existing theory assumes independent private values, which makes for elegant analysis but makes for less realistic modeling of the world auction institutions (as Milgrom and Weber 1982 persuasively argue). If bidders' private values require resale, then there can be no resale possible. If a bidder knows exactly how much a good would be worth to him. In the case of contract bidding, independent private values means that firms' production costs differ only because of differences in their production capabilities or in their alternative opportunities; however, if there is a common element of technological uncertainty, then the appropriate assumption is affiliation (Section IX). Despite the prevalence in practice of affiliation of valuations, little is known beyond the analysis of Crémer and McLean (1985a, 1985b) about optimal auctions with affiliated values.

<sup>31</sup> There is a stylized fact from the sealed bidding for mineral rights: In common-value auctions, the distribution of bids is approximately lognormal (Chester Peltó 1971; Reece 1978). Albert Smiley (1979), however, found that the Weibull distribution fitted bidding data better than the lognormal distribution. The shape of the distribution of bids is of interest for simulating bidding behavior; also, under the assumption that the theory is correct, the distribution of valuations can be deduced from the distribution of bids.

In all of the existing models, the selling is in effect done by the owner. In practice, often the owner hires an agent, the auctioneer. How can the auctioneer be motivated to act in the owner's interest? Should he be paid a fixed fraction of the selling price? Might the buyer pay the auctioneer in some circumstances? Does the presence of a hired auctioneer affect the choice of auction form?

A question prompted by the empirical studies (Gilley and Karels 1981; Hendricks, Porter, and Gertler 1986) is, What determines the number of bidders? Although most existing models take the set of bidders to be exogenous, the bidders do in fact make a decision to learn their valuations. What are the determinants of this decision? The costs of collecting information and preparing a bid presumably are relevant here (compare with French and McCormick 1984, McAfee and McMillan 1987b, Samuelson 1985). How does the incorporation of this decision affect the performance of the different auction forms? How does the choice of auction form influence this decision?

In government contracting, bids are often multidimensional, involving quality as well as price. For example, in the competition for the contract for a new fighter aircraft, design features are at least as important as price. If the government has its own preferences over the various quality attributes and price, and the different firms have different technological trade-offs, what is the best procurement mechanism?<sup>32</sup>

The advantages resulting from the seller's ability to commit himself to a mechanism have been made apparent: We know why the seller would want to commit himself. One might conjecture that

commitment is a natural concomitant of monopoly: A rational monopolist will find some way to achieve commitment. However, it is not well understood how this can be done. One way of rationalizing this is that the seller plays the game repeatedly, while the buyers play it only once. Then it might be in the seller's interest to adhere to his mechanism, for a deviation might destroy his commitment ability for the future. However plausible this argument appears, it remains to be formalized and its logical coherence remains to be established.<sup>33</sup>

The opposite question should also be addressed. What happens if we drop the assumption that the seller is able to commit himself? The commitment assumption makes the theorist's life easier by providing a clear-cut solution in place of the indeterminacy of the bargaining problem: Apart from the rents due to the informational asymmetries, all of the gains from trade go to the individual who is able to precommit himself. Without the commitment assumption, the bargaining problem must be addressed. In an interesting analysis, Milgrom (1986) developed a bargaining model in which a seller finds it in his interest to sell by auction. This is an important area for further research.

Turn now to the broader questions posed by Hayek (1945) and discussed in Section I. To what extent has auction theory generated answers to questions about the working of the price system in the presence of informational asymmetries?

The questions examined by auction theory form a subset of the class of *adverse-selection* problems; that is, problems in which one individual knows something that the others do not know (Arrow 1985). The foregoing theorems

<sup>32</sup> This question was posed by Paul Milgrom and by William Samuelson. The second-stage decision in Riordan and Sappington (1987) can be interpreted as a quality decision.

<sup>33</sup> Also, repeated games typically have many equilibria. It may be that, while commitment emerges as an equilibrium of a repeated mechanism-design game, noncommitment remains as another equilibrium.

show that bidders can be induced to reveal implicitly (or, in the case of the Vickrey auction, directly) their private information, namely, how highly they value the item. With some exceptions (given in Sections VI and VII), the bidder who values the item the most is awarded it. The Revelation Principle shows that, in many cases, individuals can be given incentives to share their information. As Hayek suggested, markets can work despite the dispersion of information.

The results described above have generated some insights into how the price system works: into the nature of the process of bidding competition and price formation. We have arrived at some understanding of why particular trading institutions—the English auction, for example—arise in particular circumstances. (See the optimal-auctions analyses of Sections VI and VII.) Do prices serve to aggregate dispersed information? The result of Wilson (1977) and Milgrom (1979a) (summarized in Section X) shows that they can: Provided there are many bidders, and provided information is sufficiently dispersed among the bidders, the price equals the item's true value even though no individual knows what this true value is. Is it correct, as Hayek asserted, that the price summarizes all of the relevant information about supply and demand? The answer is no: If competition is less than perfect it is in the seller's interest, if possible, to adjust the price after the sale in the light of any new information he obtains about the item's value to the buyer (as discussed in Section VIII).

Much remains to be done. The auction models are partial-equilibrium models. The role of the price system in coordinating the actions of different people cannot be understood except within a general-equilibrium system. How to embed bidding models in a general-equilibrium context remains an open question. Ques-

tions of the existence and social optimality of competitive equilibrium with informational asymmetries await the resolution of this question.

One crucial step toward a general-equilibrium formulation is modeling competition among mechanism designers. Consider a seller who designs an auction-like mechanism. If the buyers have an alternative, that is, if the seller faces a competing mechanism, competition may constrain the seller's choice of mechanism. If there is one phenomenon that economists understand to be important, it is competition. Solving the difficult technical problems of modeling competition among mechanisms is, in our view, the major problem facing the asymmetric-information literature.

#### XIV. *Machiavellian Advice to a Monopolist*

You are the seller of some good or service in the fortunate position of having no competitors. How should you sell your selling good? Should you set the last possible price?

The first rule of thumb that most sellers believe that they should follow is the strategy you have developed in any circumstance where you are visibly competing. This prevents you from setting your customers' prices at a level of exactly how much you are willing to sell for at any particular buying opportunity during the sale.

Should you post a take-it-or-leave-it price, or should you hold an auction? If your production capacity is large, fixing a price maximizes your expected profits. The price you should charge, if you believe your customers' valuations of your product are approximately uniformly distributed, is the average of your unit production cost and the highest possible val-

uation (provided this exceeds the lowest possible valuation). On the other hand, if you have only one or a few units to sell, you should sell by auction.

What kind of auction should you choose? To answer this question, you must know whether your customers would be prepared to pay higher prices in exchange for your sheltering them from risk. You must also know whether differences among the bidders' valuations of the item are due to inherent differences in their tastes or to their having made different guesses about the unique true value of the item.

If your customers are no more reluctant to bear risk than you are and their different valuations reflect their different tastes, then your best selling device is any of the simple auction forms: English, Dutch, first-price sealed-bid, or second-price sealed-bid. You should impose a reserve price. If the commodity is useless to you unsold, and if you estimate the distribution of your customers' valuations to be approximately uniform, the reserve price you should set is one-half of the maximum possible valuation.

If your customers prefer to avoid risk, then you are no longer indifferent among the simple auction forms; your revenue will on average be higher from a first-price sealed-bid auction than from an English auction. However, if you have very sophisticated computational capacities, you can do still better by announcing that you will require payment from bidders who bid too low and that you will subsidize bidders who bid high but not quite high enough to win. You should, if possible, keep secret from each bidder how many other bidders he is competing with.

If the bidders fall into several categories and you observe that there are systematic differences in valuations across categories, then you can exploit this to your advantage (provided you can some-

how prevent resale by the winning bidder). You do this by discriminating in favor of bidders in the category with on average low valuations: You announce that you will accept a lower bid from a member of the favored category over a higher bid from a member of another category, provided the difference in bids is not too great.

If you can monitor the buyer's subsequent usage of the commodity, you should, by the use of a royalty scheme, require continuing payments from the buyer based on value in use: Royalties induce the bidding to be more competitive.

If the item you are selling has a unique true value, but the bidders have different imperfect estimates of this value, the English auction will on average yield more revenue for you than any of the other simple auction forms. You can encourage the bidders to raise their bids by having a policy of publicizing any information you yourself have about the item's true value.

Finally, if your monopoly power is being eroded by the formation of a countervailing buyers' cartel, you can regain some of your monopoly profits by increasing your reserve price, making it higher the larger the number of cartel members.

## Book Reviews

### 000 General Economics; Theory; History; Systems

#### 010 GENERAL ECONOMICS

*The world as a total system.* By KENNETH F. BOULDING. Beverly Hills, London and New Delhi: Sage, 1985. Pp. 183. \$25.00. ISBN 0-8039-2443-7. JEL 86-0002

Human betterment is the overall aim of *The World as a Total System*. As Kenneth Boulding stated in his AEA Presidential address in 1968, "I did not become an economist for anybody's applause; I became an economist because I thought there was an intellectual task ahead, of desperate importance for the welfare and even the survival of mankind." Toward that end, this book tries—successfully—to provoke us to think about the very long course of events, and to ponder where our own daily professional interests fit in.

The first chapter's title asks: "Which systems can we perceive in the world?" and the following chapter headings answer in this order: physical, social, economic, political, communication, and evaluative systems.

The first sentences of the book give Boulding's definition of a system: "Anything that is not chaos," or "any structure that exhibits order and pattern." But I do not think these statements well describe the book's subject. All that is required for there to be an absence of chaos is an absence of independence between two elements; that is, if there is complete independence, predictability is impossible. Any incompletely-mixed urn of red and black balls permits some predictability about the color of the next ball from the color of a given drawing. But such an urn probably would not constitute a system for Boulding. And a baseball breaking a window at which it is thrown is not only predictable but is thought of as causal, yet it also would not be the sort of system that Boulding discusses.

A better though more turgid definition of "system": A set of elements that we analyze on a particular dimension and at a particular level of abstraction, a set within which if one fails to take proper account of some elements, understanding of the behavior of other elements is in peril. The practice of economists in thinking of an economy as a system in this fashion is a great strength of our discipline compared to the other social sciences, when considering rent control, for example, economists immediately ask about not only the direct effects on the rents paid by the poor—at which point the thinking of too many noneconomists stops—but also about such indirect effects as upkeep, new construction, and a shift to investment in other markets. This is the single lesson in Henry Hazlitt's *Economics in One Lesson*. And indeed, true to his origins as an economist, a key aspect of all the systems that Boulding deals with is sufficient complexity such that any sound thinking must take . . .

interrelationships—obvious relationships between baseball to win-

Boulding points out that in delineating a few systems, we are describing them in a way that knowledge is encyclopedic, reduced to think about the system in more comprehensive ways. This valuable exercise, which promotes understanding and triggers new ideas, is Boulding's purpose, I believe, and he succeeds admirably.

Valuable as is Boulding's emphasis on grand abstractions, there also is a drawback, focusing our attention away from the concrete. In this respect, I confess to a bias in favor of the point of view espoused by William James, who frequently and forcefully asserted the importance of keeping touch with nitty-gritty experience. Focusing on models can lead into error even as wise and careful a student as Boulding. Consider this example:

The change in the physical system of the world, closely related to certain changes in the biological and social systems, that presents perhaps the greatest source of concern for the human race at the present is soil erosion . . . this is a problem of the same order of magnitude as the using up of fossil fuels, and we may have even less time to correct this imbalance. This is something that we simply cannot afford to lose. (p. 47)

Soil erosion does cause concern. But the concern is misplaced. There are no data showing deterioration of the land worldwide; the only relevant evidence is data showing that the quantity of arable land is increasing rather than decreasing. And in the United States, where there are data bearing directly upon soil erosion, the condition of farmland has been improving rather than deteriorating since the first measurements in the 1930s, as Theodore Schultz attests from his own experience since boyhood as well as from the survey data (1982). And Earl Swanson has shown that the main problem that soil erosion causes is costly silting up of drainage systems, rather than loss of productive capacity of farmland (1984). Such erroneous assessments—like the errors of the 1970s about supplies of oil and minerals and food—can be extremely costly to society, not only in misallocated resources but also in unsound governmental decisions and in morale. And it seems to me that fascination with abstractions—world systems and computer models—often leads away from attention to data, and hence is an important cause of such errors.

Playing with grand systems is playing with fire. Like fire, Kenneth Boulding always illuminates.

This volume contains the proceedings of an NSF-sponsored conference that gathered non-economist social scientists to explore the scope of regulation research in their disciplines. The essays are a diverse lot, as their origin would suggest. Rather than commenting on the merits of specific contributions, this review focuses on the lessons which economists might draw from the volume.

It is immediately apparent that the economist's approach to analyzing the forces governing regulation has few adherents in other social sciences. Economists typically analyze political markets in much the same way they approach economic markets. Decision makers optimize subject to constraints imposed by, among other things, the actions of those affected by their decisions. The objective function can incorporate regulator preferences distinct from the preferences of those the regulation affects, but those preferences must be reasonably stable. Most of the contributors to this volume conceive of the political process in quite different terms. Several argue that the state can and does act autonomously, hatching policies it then sells to the governed. For this conception to constitute an alternative to the economic approach, the state must not only have an objective function of its own, but the tastes reflected in that objective function must shift significantly over time. It is not surprising that a number of political scientists, attracted to their specialty by the notion that elections matter a great deal, assert the primacy of political actors, as opposed to the alternative view that policies shift primarily in response to exogenous changes in the well-being of those touched by regulation.

The contributions by Theodore Lowi and Morris Fiorina are compatible with the economist's view, but represent a distinct minority. Lowi reiterates his position that exogenously chosen policies induce the politics and institutional structures that surround them. Lowi's discussant, John Ferejohn, takes sharp issue with this direction of causation, arguing that

if there is one major theme of studies of American policymaking institutions . . . it is that the scope for political leadership is broad and that leaders possess a great deal of discretion. . . . [Policymaking] institutions and the social processes that evolve within them appear to possess powerful internal dynamics that inhibit their direction by external social or economics forces. (p. 106)

Fiorina's interesting analysis of the delegation of legislative authority looks very much like an economic analysis. His discussant, William Riker, while justifiably admiring the paper, remarks that Fiorina's analysis does not go far enough in casting his model as one where politicians choose according to their preferences rather than in terms of the costs and benefits of the clients they regulate. While perfectly consistent with an economic approach this perspective, when implemented, yields very different treatments of regulation.

Emphasizing the autonomy of political actors encourages the investigator to focus on individual participants of the political process. Thus, an essay by Martha Derthick and Paul Quirk entitled "Why the Regulators Chose to Deregulate," a question that few economists would pose, is included. Derthick and Quirk illustrate the idiosyncracies of the regulatory process, concluding that in the cases they examined economic ideas embraced by powerful regulators constituted the "coordinating force in a governmental universe that is normally chaotic" (p. 230). We are told neither why particular ideas proved compelling nor why regulators embraced ideas that others proved able to resist. The approach lacks the means to predict the behavior of regulators.

An alternative to focusing on regulators is to consider the organizational structures within which they operate. Unfortunately, the essays that focus on organization, while presenting a wealth of interesting detail, support James Q. Wilson's (ultimately sympathetic) observation that organization theorists "believe earnestly that [organization] theory . . . must surely tell us something important, but in the last analysis one is not sure that one has learned anything" (p. 359).

Lawrence Friedman's elegant essay argues that legal arrangements "carry all the freight of the social order" (p. 135), and so place constraints on the system that require those seek-

ing benefits at least to be able plausibly to cast their pleas in terms other than naked self interest. Regulation is shaped by forces more complicated than those incorporated into economic models. Analysts are charged "to scoop up as many facts as possible . . . about . . . legal arrangements, even when the facts do not lend themselves to scientific treatment" (p. 135). This advice, echoed by anthropologists Laura and Clair Nader, would be more compelling if coupled with a clear demonstration of insights it generated. Indeed, Friedman's thesis that considerations of morality and fairness embodied in legal rules reduce dramatically the scope for self-interested control of regulation receives a strong if implicit challenge from fellow lawyer Bruce Ackerman later in the volume. Ackerman's call for a constitutional change is based on his view that legal structures can, but do not now, check the control that special interests exert on the regulatory process. Without a scientific winnowing of the mass of institutional detail surrounding regulation, informed choices among such positions are impossible.

Perhaps the one point on which the contributors could agree is that the economic approach to regulation is far too confining to be useful in the understanding of the determinants of the regulatory policies we observe. Regulation is based on a narrow view of the economic approach. It is as if the only choices were terminal. The analysis is treated as a confirmation of the view that the regulatory process is the view that the industries themselves have created rather than as an attempt to understand the equilibrium in political markets. Regulation is subjected to the standard comparative static methods of economics. Focusing on the constraints which well-organized interest groups place on regulators does not imply that regulation must forever maintain its initial form and effect. Changes in the economic well-being of interest group members change the constraints that regulators face, with predictable changes in regulations over time. Curiously, Peltzman's (1976) pioneering analysis along these lines is ignored completely.

In sum, this volume contains a number of suggestions as to how regulation might better be understood, but few successful demonstrations of the utility of approaches advocated.

The essays can be useful both in helping to formulate the set of constraints under which regulators operate and in cautioning against too ready acceptance of narrow self interest of one or a few groups as the determining factor in policy making. They are less successful in providing guidance for how regulation research should be conducted.

#### 020 GENERAL ECONOMIC THEORY

*Sour grapes: Studies in the subversion of rationality*. By JON ELSTER. Paperback reprint. Cambridge, New York and Sydney: Cambridge University Press; Paris: Editions de la Maison des Sciences de l'Homme, [1983] 1985. Pp. viii, 177. \$12.95, paper. ISBN 0-521-31368-6. JEL 86-0352

Economists try to describe human behavior. So do philosophers, anthropologists, sociologists, political scientists, psychologists and social biologists. Some try to set boundaries separating their domains from those of other disciplines, but boundaries are always crossed. Economists have analyzed topics such as voting behavior, crime and its deterrence, and the division of labor by sex, topics that noneconomists claim as their own.

Hirshleifer (1985) provides an excellent review of the invasion by economists of other fields and notes that this invasion has a flip side. "While scientific work in anthropology and sociology and political science and the like will become increasingly indistinguishable from economics, economists will reciprocally have to become aware of how constraining has been their tunnel vision about the nature of man and social interaction" (p. 53).

Indeed, economists are beginning to use knowledge from other fields to explain phenomena that have long been considered puzzling. For example, Thaler and Shefrin (1981) use self-

control to explain why people sometimes restrict their choice set, Akerlof and Dickens (1982) discuss the economic consequences of cognitive dissonance, and Loomes and Sugden (1983) use regret to explain preference reversal.

The assumption that man is rational is at the center of standard models of economics. Elster's book focuses on that assumption and uses findings from other fields to argue that rationality cannot provide an adequate basis for the description of human behavior.

Rationality is a concept with many definitions, and Elster begins by providing his own. He makes a distinction between thin and broad theories of rationality. The thin theory is centered around consistency within a system of desires and beliefs. The broad theory examines both desires and beliefs. Rational desires are formed in an autonomous way, and rational beliefs are grounded in judgment based on the available evidence.

The chapter about rationality serves as an introduction to three chapters about the difficulties in using rationality to describe human behavior. In Chapter 2, Elster argues that it is difficult to reconcile the notions of autonomy and judgment with the fact that some states cannot be willed. For example, the attempt to overcome insomnia by sheer will is an expression of autonomy, yet it is a paradigm of irrational plans.

Elster uses the notion of sour grapes (or cognitive dissonance) as the most prominent example of nonautonomous preferences, and he elaborates on this idea in Chapter 3. The essence of the sour grapes story is that preferences may themselves be shaped by outcomes. The fox bends his judgment and desires to conform to the fact that he cannot reach the grapes.

While Chapters 2 and 3 focus on autonomy, Chapter 4 focuses on biases in the formation of beliefs and in judgment. How can we say that people base their judgment on available evidence, asks Elster, when we know from studies by psychologists that people make systematic errors in inference. And how can we say that judgment is based on available evidence when we know that people engage in self-deception?

Good books stimulate thinking, and I found myself reflecting on the importance of auton-

omy and judgment in explaining human behavior. People frequently abandon autonomy and they suffer from persistent biases in judgment. If autonomy and judgment are the underlying characteristics of rationality, as Elster argues, perhaps people are not rational. But if people are not rational, what are they?

Elster states early in his book that he believes that human behavior reflects maximizing behavior, and he mentions some ideas which might describe observed behavior better than his concept of rationality. One is the Darwin-based idea that maximizing behavior contributes to the survival of a person and his descendants. Elster does not explore the potential of this framework, although it might explain much observed behavior.

Survival seems to depend on a delicate balance between opposing forces. For example, the brain generates pain, but it also soothes pain. Each can be used to excess, and survival depends on a proper balance.

Frustration is generated when a gap exists between what we have and what we want. Frustration, as Elster notes, is a manifestation of autonomy, and it is useful to survival because it propels us to achieve what we want. But what should we do when the achievement of our initial goal turns out to be too costly? Sour grapes rationalization may be a good way to disengage from the pursuit of a hopeless goal. Of course, a balance between frustration and rationalization is needed. Those who always avoid rationalization are likely to become entrapped and "throw good money after bad." Those who make heavy use of rationalization avoid frustration, but they accomplish little.

Elster tries to convince us that the exercise of autonomy and judgment do not characterize much human behavior. He succeeds. More importantly, he leaves us with some ideas about frameworks that might better account for a wide range of human behavior.

Concern about relative standing has been a minor theme, at best, in modern economics. It has been cited occasionally, of course, to address specific issues—Duesenberry's classic analysis of savings being a leading example. But, perhaps because it is associated with traits we find unappealing, most economic analysis ordinarily presumes that agents are atomistic, utility and profit-maximizing entities. Robert Frank's task in this original and provocative book is to demonstrate that concern for status deserves a much more prominent place in our understanding of economic behavior. As he makes clear, recognizing its importance carries significant implications for how we view the role of public policy and the role of government itself.

The first part of the book, illustrating what we mean by concern for status as a determinant of behavior. In chapter 2, evidence is presented from psychology, sociology, and social anthropology that concerns are pervasive. At the most fundamental level, a hierarchy of status is traced to the evolutionary advantage of asserting dominance over one's reference group. Accordingly, defining one's goals and measuring one's achievements against those of others is well-founded and ingrained; moreover, in a world of incomplete information and imperfect foresight, people tend to set their personal baseline in terms of a local group of peers that is rather narrowly drawn, both in time and place.

Chapters 3, 4, and 5 trace out the implications of the basic proposition that position in local hierarchies matters in a range of economic examples. Concern about status is offered as an explanation for the frequently observed flatness of pay schedules. Earnings based on marginal

productivity are adjusted by market pressures to reflect positive and negative status associated with position in the local income hierarchy. Although other plausible arguments, including risk-aversion on the part of employees and the existence of internal labor markets, have been advanced to interpret this leveling tendency, the author's appeal to status as the determining factor is convincing in settings where uncertainty or firm-specific learning would seem to be a less important characteristic.

In anticipation of broader issues raised later, an argument is also roughed out to suggest how a very large set of individuals with varying skills and tastes for status might sort themselves in equilibrium into the empirically observed pattern of heterogeneous groups. The operative reference group need not be narrow in every case. Frank argues in Chapter 6 that redistributive taxation can be viewed in part as a macroeconomic counterpart to the flattened earnings schedule at the firm level in the sense that it reflects an implicit voluntary social contract motivated by similar, fundamental positional concerns.

Clearly, not everyone can be in the top rank. Chapter 7 takes up the problem that striving for position has an inherently illusory aspect. In the absence of cooperation, the divergence between individual and collective self-interest can give rise to significant, pervasive distortions. As we are shown, this is especially the case when the concept of position is extended to encompass the prospective standing of one's heirs and when conspicuous consumption is made part of the process of signalling one's ranking. These distortions include a tendency for people (especially at low income levels) to invest too little in safety, insurance and other risk-reduction measures and too much in "positional goods." Chapter 8 applies these observations to interpret the tendency for savings ratios in cross-sectional samples to rise with income. The role of trade unions in promoting pensions, insurance, safety rules, and paid leave also is presented as a manifestation of implicit cooperation among workers who would otherwise be subject to the negative externalities of the "positional treadmill."

The final four chapters address broader issues related to the nature of the underlying social contract that supports the political economy and

public policy. The observation that much economic behavior is influenced by concern over position, with its attendant negative externalities, opens the way for an effective rebuttal of stylized critiques of the free-market system. Contrary to commonly expressed views of the left, positional concerns are seen to lead workers to accept less individual control of employment conditions, to select less differentiated and personalized service, and to be more prone to "manipulative" advertising—not on account of market failure or exploitation in their conventional senses but precisely because markets for goods and services take into account people's fundamental need for superior position. Similarly, the strict libertarian position that rejects any compromise of individual freedom is also seen to be amiss in that it fails to account for the reciprocal, interactive character of status seeking.

Since positional concerns generate negative side effects for society as a whole, it follows that collective welfare can be improved by some form of joint intervention. In Chapter 11, Frank explores the general issue of the limits to governmental paternalism and develops a generalized unanimity criterion not unlike the rule for a constitutionally authorized voting procedure described by Buchanan and Tullock. The criterion amounts to a simple expected cost-benefit test with a side provision to rule out restrictions that will cause coalitions to break apart. Exceptions are admitted for rules with major adverse consequences; partial restriction through taxation is also considered.

The book concludes with applications to public policy that stress accurate diagnosis of economic problems and the advantage of relying on market forces in any intervention. The basic second-best prescriptive rule still applies: distortions should be treated with measures that counteract the problem most directly. Thus, the author favors a consumption tax on commodities, the consumption of which imposes externalities on others. In antitrust policy, he reminds us that market concentration by itself is not sufficient cause for regulation, as it may largely reflect buyers' preference for low-priced standardized commodities that large-scale firms seem able to produce most efficiently. (No bright-line rule is offered, however, to distinguish cases in which concentration arises, say,

from over-consumption of positional goods or from the more familiar exercise of market power.) A negative income tax, supplemented by government-sponsored employment and transfers in kind, is proposed as the appropriate and efficient means of accomplishing socially desired income transfers.

Taken as a whole, the book raises a number of important questions about human behavior. It is evident that positional concerns will be heightened and most relevant when economic activities and transactions have an all-or-nothing character. Thus, important questions are: To what extent are economic interactions so structured? Secondly, to what extent is it sufficient that economic agents merely *perceive* economic reality in relational terms? Do conclusions depend in an important way on limited rationality—a condition that might be altered by better information? One of the important messages of the book is that the positional aspect of economic activity is endemic and manifest in a surprisingly wide variety of settings. Although some of the applications may seem to stretch the concept, almost all the evidence and examples that the author has marshalled are apt and persuasive. Still, the issue is essentially an empirical matter that invites further research.

Irrespective of the outcome of that inquiry, it is fair to say that this book is a significant contribution and accomplishment. The arguments are original, carefully constructed, and balanced. The material should sensitize readers to a neglected and important aspect of economic behavior, and raise the quality of the public debate on a wide variety of issues. Finally, no review would be complete without its taking note of the book's lively and entertaining style. This book is fun to read—no less so for the author's inclusion of a number of drawings and cartoons from *The New Yorker* and other publications that highlight key points with wit and charm.

RICHARD T. FREEMAN

*Federal Reserve Board*

*Game-theoretic models of bargaining.* Edited by ALVIN E. ROTH. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. ix, 390. \$47.50. ISBN 0-521-26757-9. JEL 86-0664

This volume of revised papers, originally presented at a conference held in June 1983 at the University of Pittsburgh, provides an excellent overview of game theoretic bargaining theory. This field studies the type of agreements that rational agents will achieve in bargaining situations. It is composed of two complementary approaches—the axiomatic, or cooperative, and the strategic, or noncooperative. The axiomatic approach consists of specifying a set of axioms, such as efficiency, which the result (or outcome) of bargaining should satisfy, and characterizing the function mapping the set of feasible outcomes into itself that satisfies the axioms (in general, it will be unique). In the strategic approach the detailed structure of the bargaining process (including what the agents know) is written down as a game tree and the equilibria analyzed. Since the axiomatic approach abstracts from the details of the bargaining process, it has the advantage that it is applicable to many bargaining situations. The disadvantage of the axiomatic approach is that the details of the bargaining process are not important in determining the outcome. In the strategic approach the details of the bargaining process are important, but the outcome is determined by the equilibrium. The two approaches are well complemented.

Unfortunately it is not possible to review all the papers in this review. In what follows I discuss a subset, concentrating on strategic models since this is the area of most active research.

Robert Wilson discusses various dynamic models that have "reputation" as a state variable. In games with incomplete information, an agent's reputation is the beliefs of the other agents about his private characteristics (or infor-

mation). This notion of reputation has become important in economics and this paper is a valuable survey of the concept in its various incarnations. The paper by Drew Fudenberg, David Levine and Jean Tirole analyzes the following bargaining game: A buyer and a seller negotiate over a price, with the buyer's valuation not known by the seller and offers made sequentially by only the seller. They prove that this game has a unique (sequential) equilibrium. While Gul, Sonnenschein and Wilson (1986) subsequently strengthened this result by showing that in this equilibrium the sequence of price offers is not random, the Fudenberg, Levine and Tirole paper is still well worth reading.

Although the one-sided offer bargaining game (often called a concession game) with the uninformed agent making the offers has a unique outcome, the two-sided offer game does not. The source of the multiplicity is much the same here as it is in the signaling models of Spence (1974) and others. The problem is that the informed agent makes offers that must be interpreted by the other agent. Different methods of interpreting offers give rise to different equilibria. Ariel Rubinstein's paper presents an analysis of different methods of interpretation in a two-sided offer bargaining game where one of the agents has two possible costs of bargaining. Restricting the choice of conjectures when an informed agent makes an out-of-equilibrium move as a means of selecting equilibria is an attractive idea which is the focus of much current work; Rubinstein's paper contains a clear discussion of some of the issues involved. The ideas in this paper apply more generally, not just in bargaining. However, the game Rubinstein analyzes is simple (private information takes only two possible values) and the appropriate restriction on conjectures is not always obvious.

In the papers so far discussed, the rules of bargaining have been exogenously given. In mechanism design, the idea is to design a game form that respects the sovereignty and private information of the agents and whose equilibria satisfy some welfare criterion. Roger Myerson, who has written widely on mechanism design, analyzes the efficient mechanisms for two bargaining problems (one of which is the lemons problem of Akerlof, 1970). Viewing bargaining from a mechanism design perspective can lead

to important insights; for example, private information may make it impossible to guarantee that a bargain will be made if there are gains from trade (i.e., bargaining may be necessarily *ex post* inefficient). However, it can be difficult to separate normative from positive considerations in mechanism design, and in his paper Myerson is perhaps not sufficiently clear on this distinction. In particular, Myerson seems to claim that agents in a bargaining situation would always agree on an efficient mechanism. It is not clear to this reviewer why they necessarily would so agree. Peter Cramton analyzes a sequential mechanism where the *ex post* inefficiency mentioned above appears as delay to agreement. The paper by Kalyan Chatterjee is a survey of models which predict a positive probability of breakdown in bargaining due to incomplete information. William Samuelson's paper addresses the related issue of the efficiency of various methods of assigning property rights in cases involving externalities.

Ken Binmore's contribution studies three person bargaining problems. In particular, the connection between some solution concepts derived from cooperative theory and the equilibria of various extensive form games is examined.

There are also papers on strategic models by Robert Rosenthal (who views reputation as a summary statistic of past behavior), Martin Osborne (who analyzes the role of risk aversion in a simple strategic bargaining model), Alvin Roth (reviewing some of his experimental results), Joel Sobel (who focuses on the burden of proof in a litigation model) and Vincent Crawford (contrasting the theoretical bargaining with the third-party arbitration literatures).

The papers on axiomatic models are by Stef Tijs and Hans Peters (also analyzing the role of risk aversion, but in axiomatic models), William Thomson (surveying results in the axiomatic theory when the number of agents can vary) and Sergiu Hart (discussing recent axiomatizations of solution concepts for multiperson games).

This volume of conference papers is highly recommended. The issues discussed in it are central to economics (what is more fundamental to economics than the bargaining problem?) and the discussion is well worth reading. The only warning is that, by necessity, over half of the papers are highly technical. The nontechnical

papers, however, can be read profitably by all economists.

On the cover of *General Equilibrium Analysis: Studies in Appraisal* by Roy Weintraub one can read that Weintraub

argues that previous writings on the history and method of general equilibrium theory have been curiously biased and misleading. Weintraub provides a clear and careful presentation of the development of the theory from the 1930s through to the Arrow-Debreu work of the 1950s. This historical analysis is the center of the book.

Without this explicit claim the book could have been viewed as an interesting and entertaining readable account of the overall development of general equilibrium analysis in the period in question. There are many hitherto unpublished anecdotes and quotations from letters that cast an interesting light on the period in question. This is also true for the biographical sketches of the main actors in this period.

However, when one looks at that part of the book which could justify the claim that it offers a "clear and careful presentation of the development of the theory . . ." and is a "historical analysis" the book does not live up to one's expectations. To see why this is so I leave aside the "classroom interludes" I-IV and concentrate on Part II, Chapter 6: The existence of a competitive equilibrium: 1930-1954.

The endpoint of this period is clear; the pub-

lication of two fundamental contributions in *Econometrica*: the paper by Kenneth Arrow and Gérard Debreu (1954) and the other one by Lionel McKenzie (1954). Why the particular date for the beginning of the period, 1930, is chosen is less clear. It is generally agreed upon, that after Walras and before 1954 credit has to be given for the formulation, or solution, of the existence problem of competitive equilibria to Gustav Cassel (1918), Frederik Zeuthen (1932-33), Hans Neisser (1932), Heinrich von Stackelberg (1932-33), Karl Schlesinger (1935) and, in particular, Abraham Wald (1935, 1936a, 1936b). All these names are already mentioned in Arrow-Debreu (1954), Section 6. Less commonly known is, however, the exact content, the importance and originality of these contributions. Those readers who expect Weintraub to give a concise summary and comparison of these contributions will be rather disappointed.

The starting point is Cassel's well-known simplified version of Walras' model of an economy with production. This has  $r$  factors of production,  $n$  consumption goods, one process of production with fixed coefficients for every consumption good, fixed (price-independent) income distribution, and hence a market demand function which depends only on the prices of consumption goods. To make "Cassel's simplification" more transparent I would have preferred using Wald's

Leçon 20) as a starting point. Weintraub's version is actually and/or mathematically

After emphasizing the role of Cassel's *Theoretische Grundlagen* played in popularizing general equilibrium theory, Weintraub mentions the Vienna Colloquium, and the simplification of the Cassel equations. Yet the essential step—the introduction of slack variables for the factors of production and the complementary slackness conditions—had been made earlier by Zeuthen (1928 and 1932-33) who in this context is mentioned (p. 66) by Weintraub in one sentence in parentheses. The omission of a clear summary of Zeuthen's contribution is inexcusable. The statement on page 115 (first paragraph) by Weintraub does not do justice to Zeuthen and the history of the development of the theory.

Of course we have no reason to doubt Schle-

singer's word that he had heard about Zeuthen's paper only after his presentation in the Colloquium (1935, p. 11, fn. 3). But his claim (p. 12, fn.) that Zeuthen introduced the modifications of the Cassel equations not in connection with the problem of finding an economically meaningful solution is rather difficult to accept. Could he really have misread Zeuthen to that extent?

It is true that Zeuthen did not discuss the existence problem in general. He computed, however, the competitive equilibrium in an example for more than 20 different parameter values (he varied the supply of a factor of production, a production coefficient and the price-elasticity in the demand functions—see Tables 1–3, pp. 7–10, 1932–33; or for more details, 1928, p. 27). For the majority of these parameter values the original Cassel equations would have no economically meaningful or no solution at all. Zeuthen introduced the complementary slackness condition precisely in order to obtain meaningful solutions, i.e., equilibria, in his examples. What other reason could there be? Schlesinger's claim was repeated by Arrow-Debreu (1954) and hence became accepted. ("Indeed, this suggestion [complementary slackness] had already been made by Professor Zeuthen . . . though not in connection with the existence of solutions" p. 288.)

As with Zeuthen's contribution Weintraub does not summarize the papers by Neisser and von Stackelberg, nor does he give the examples they used to show the difficulties in Cassel's equations. This omission is, of course, less serious since, when these authors gave their examples Zeuthen had shown already how the model had to be modified.

Weintraub describes Menger's Colloquium quite eloquently and, in particular, the arrival of Abraham Wald in Vienna. This part of the book is very interesting and many readers will enjoy the quotations and anecdotes. But when the story comes to Wald's existence proof the air becomes thin again. The assumptions of the theorems are stated in full, yet there is no summary of the essential arguments of the proof that would show how these assumptions are used. This is, in my opinion, a serious omission. I assume that many readers would like to know why in Wald's proof (1936a) his famous assumption (6) (i.e., a version of the weak axiom of

revealed preferences for the market demand function) is needed for the existence part of the proof.

Here is another question: What role does the assumption play that the market demand function is invertible? Is this assumption only made since Schlesinger's modification of Cassel's equation is formulated in this (unsatisfactory) way?

In conclusion then this book should not be read as a precise historical analysis of the main developments in general equilibrium analysis in this brief but important period. Nor should the reader expect to find a careful analysis and comparison of the few major papers involved.

However, the less exacting and less specialized reader will find an entertaining and colorful account of a very stimulating period in the development of economic theory.

030 HISTORY OF ECONOMIC THOUGHT;  
METHODOLOGY

*Making sense of Marx.* By JON ELSTER. Studies in Marxism and Social Theory series. Cambridge, New York and Sydney: Cambridge University Press; Paris: Editions de la Maison des Sciences de l'Homme, 1985. Pp. xv, 556. \$15.95, paper. ISBN 0-521-29705-2.

JEL 86-0671

Jon Elster sets himself the ambitious task of critically reviewing the whole range of Marxist social, political, and economic theory. He brings to this task formidable scholarly resources: a wide acquaintance with Marx' writings; a good technical understanding of important recent developments in general equilibrium and game theories; and an evident desire to read Karl Marx without prejudice. Unfortunately Elster's adherence to a narrow reductionism in the philosophy of knowledge and his inability to recognize reliably the level of Marx' arguments make this book a doubtful and misleading guide to Marx' thought and limit its interest as a contribution to social theory.

Elster begins by stating his adherence to a principle of "methodological individualism", "the doctrine that all social phenomena . . . are in principle explicable in ways that only involve individuals—their properties, their goals, their beliefs and their actions" (p. 5). Elster criticizes as "functionalist" many cases where Marx attributes goals, strategies, or perceptions to groups of people rather than to "individuals." He believes that an explanation of collective action must provide "micro-foundations for the behavior, that is, explain it in terms of the desires and beliefs that enter into the motivation of the individuals participating in it" (p. 16).

This is a poor philosophical starting point for understanding Marx. Elster objects to functionalist explanations of group behavior but not of "individual" behavior. Groups, however, share goals, conceptual frameworks, and means for action, and often act in concert, either spontaneously through their shared evaluation of a situation, or through formal coordination. Fur-

thermore "individuals'" goals, concepts, and actions are strongly influenced by the existence of groups. Thus it is unclear why explanation should always start at the level of "individuals" (though the problem of understanding the relation between group and individual behavior remains a cogent issue regardless of the starting point). Elster never explains what he means by an "individual." When he offers examples of the kind of "micro-foundations" that he would like to see Marx supply for his "functionalist" explanations, he invokes neoclassical economic equilibrium theory or game theory, theories in which the agents are arbitrarily defined and can be interpreted as organizations (corporations, governments, families, and so forth) rather than as individual people. Marx accepts the commonsense idea that groups, in so far as their members share goals, concepts and means of action, may act functionally. In some cases he feels the need and takes the trouble to investigate the relation between the actions of members of groups and of the groups themselves (as in his analysis of technical change under capitalism), but in many other cases he sees the issue as of secondary interest. Elster's interposition of the arbitrary doctrine of methodological individualism does not help us to understand Marx' . . .

For economists at least satisfactory theory of value and theory of exploitation and contributions of

In his discussion

Elster uncritically took

originated by Ladislaus von

developed by Michio Morishima and Francis Seton, as expounded by John Roemer. This interpretation of the labor theory of value rests on three premises. First, it regards the labor theory of value as a theory of relative prices of commodities. Second, it requires an imputation of the total labor time of society to the commodities produced. Third, it understands the concept "value of labor-power" in Marx to mean the concrete labor embodied in the commodities workers consume. Elster makes much of the well-known (even to Marx) arguments that these premises lead to contradictions and impasses. The imputation of labor time to individual commodities is not a necessary step in

establishing their relative prices. In the presence of heterogeneous labor (or joint production, a more serious problem Elster neglects) a unique imputation of labor time to commodities may not be possible. Finally, even in the most favorable case where this imputation is unambiguous, the interpretation of the value of labor-power as the labor embodied in what workers consume makes it impossible to regard the total surplus value of the society as arising from the unpaid labor time of workers. Elster, in accepting this interpretation, is led to reject the relevance and coherence of Marx' elaboration of the labor theory of value.

But this line of argument misrepresents Marx' interpretation of the labor theory of value. Marx saw the theory as a way of linking social labor, commodity production and money measures of value at an aggregate level, not in the first instance as a way of determining relative prices. Marx' discussion of "abstract" labor indicates that he did not view the imputation of concrete labor time to different commodities as important in his development of the theory. Although he does refer to the determination of the value of labor-power by the cost of the commodities necessary to reproduce workers at the historically and socially given standard of living, his consistent practice is to define the value of labor-power as the proportion of abstract social labor time workers receive control over in the form of money wages. This definition turns out to be completely consistent with the idea that social surplus value arises from the unpaid labor of workers. Elster has not discovered these important facts in his own reading of Marx, nor has he read the work of Isaac Rubin or Gerard Dumenil that explains these points. (The single footnote to Alain Lipietz' article on this problem shows no understanding of the issues involved.)

Elster's discussion of Marx' theory of exploitation is also unsatisfactory, largely because he allows himself to be misled by Roemer's work into a conceptualization of exploitation that Marx explicitly rejected. Elster says that exploitation "means, fundamentally, working more hours than are needed to produce the goods one consumes" (p. 167). Marx went to great

pains to rebut this concept of exploitation. For example, Marx makes the point in the *Critique of the Gotha Programme* that neither in the initial nor the final phases of socialist society would workers be able to consume goods that contained as much labor as they expended. Elster moves even farther from Marx in putting forward the curious idea that the part of surplus value capitalists invest to increase future production should not be viewed as having been exploited from workers. For Marx exploitation occurs when one class takes control of part of the labor expended by another, regardless of what they do with it. Elster's confusion about the theory of exploitation is puzzling because in his chapter on the Marxist theory of class he states a recognizably Marxian formulation of the problem: "the central relations between classes are the transfer of surplus from below and the exercise of power from above" (p. 341).

Although Elster's discussions of class, the State, and ideology are more satisfactory, extreme caution is indicated in using this book as a guide to or critique of Marx' thought.

*Rivalry and central planning: The socialist calculation debate reconsidered.* By DON LAVOIE. Historical Perspectives on Modern Economics series. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. x, 208. \$34.50. ISBN 0-521-26449-9.

JEL 86-0367

The central thesis of this book is that the "Great Socialist Debate" of the 1930s has not been resolved, as the traditional view holds, but rather that the Austrian position as first presented by Ludwig von Mises has been grossly misunderstood. From close textual analysis, Mises is shown to have confronted two important paradigms, the Marxian and neoclassical ones. The challenge of Mises, called the *advocatus diaboli* of socialism by Oskar Lange, is not yet answered. Those who have taken up the gauntlet have failed to understand Mises' point, reiterated by Friedrich Hayek, that private property leading to the pursuit of profit in rivalrous markets is necessary for the *creation* and diffusion of the information required to solve the economic problem of Vilfredo Pareto and Enrico Barone.

To characterize Mises' (1920 German) argument simply:

no private ownership of the means of production implies no markets, no markets implies no "rational" prices for the means of production, consequently, socialism (i.e. nonprivate ownership of the means of production) can not achieve an efficient allocation of resources.

According to Lavoie, the neoclassical school misinterprets Mises' understanding of socialism. In Chapter 2, an ideological link is forged between socialism and central planning by reference to Karl Marx' critique of market anarchy. Chapter 3 argues that Mises agrees with Marx—markets are inherently rivalrous—although he focuses on the way this competitive struggle among agents seeking to maximize their own self interest *searches out and dispenses* the very information necessary to bring about the harmony of Adam Smith's invisible hand.

According to Lavoie, the conventional view of the debate attributes to Barone (1908 Italian) or even Friedrich von Weiser (1899 German) the position that rational allocation under either socialism or capitalism can be separated from

market institutions by considering an algebraic representation of the relative valuations implicit in any scarcity problem. In Chapter 4, Lavoie argues that the participants were misled by the neoclassical view of resource allocation as a "solution" to the "static" problem of Pareto given the three preconditions specified by Barone, i.e., society has a method of choosing among various final products, the primary resource base of the economy is given, and all available methods of transforming resources into final output are known. Borrowing Taylor's "trial and error" example of calculating Barone's relative valuations for the means of production (intermediate goods) given some final output mix, Lange described a detailed system of socialist market simulation in which prices as "terms of alternatives" would be determined.

Conventional interpretation holds that Hayek accepted the theoretical possibility of solving the resource allocation problem without private property but denied its practicality. However, Lavoie contends that Hayek (1940) refined Mises' position on markets as a necessary condition to the discovery and provision of the information assumed to be given in Barone's problem. Hayek restated the need for agents to adjust continuously to changing conditions (the Austrian view that markets are in a state of permanent disequilibrium) and established the crucial role of profit movement in the process.

While I support Mises' arguments, some accounts of that he himself of the critique in Chapter 6 of the market simulation sovereignty (democratic socialism) and using Lange's case for socialist planning. If the subject matter of the book were only the debate, such an omission might be justified. However, Chapter 6 (pp. 153-58) contains an overview of the Soviet experience with planning that indicates a serious misunderstanding of the goals of socialist planning. Chapter 6 and the following brief conclusion seem somewhat repetitious, stating essentially that a coherent, consistent position was sustained by the Austrians contributors and misunderstood by the others.

Lavoie's use of modern economic theory to

explain the concepts and issues in the debate indicates some misunderstanding of the instrument. For example, *tatōnnement* and *nontatōnnement* processes seem often confused especially when income distribution is discussed. Peter Murrell's (1983) interpretation of the debate using informational economics is clearer. Like Lavoie, Murrell thinks that Mises' argument is more sophisticated than is generally acknowledged; he even shows that Mises was aware of Barone's relative evaluations. Murrell argues that Mises' questions asked from the Austrian perspective of the entrepreneur's role in anticipating and effectuating change were not answered by his critics who heard with the ears of the Walrasian-Paretian-general-equilibrium-welfare economist.

In honoring consumer sovereignty, the market simulation model attempts to embrace one blade of the Marshallian scissors (demand) without building the foundations of the other blade (supply). In order to replicate Marshall's long-run efficient allocation of resources, Lange's managers must be intertemporally omniscient and socially motivated so as not to exploit the value of their knowledge. The strength of this book is its convincing presentation of the issues in the debate from the Austrian perspective using continuous time rather than Marshall's discontinuous runs. However, until we have an intertemporal general equilibrium model of Austrian rivalry or an integration of informational theory (and perhaps contestable markets) with standard neoclassical theory, the "Great Socialist Debate" as characterized here will remain unresolved. Accompanied by Murrell's article, Lavoie's book leads the neoclassical economist to a better understanding of the competing paradigms.

*Marshall, orthodoxy and the professionalisation of economics*. By JOHN MALONEY. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. x, 278. £25. ISBN 0-521-301-72. JEL 86-0039

Dr. Maloney has written an important book. His subject is a dual one. First, he seeks to explain why the Marshallian orthodoxy gained ascendancy over its rivals (ranging from the historicism of Cunningham to the polemics of Macleod), principally in the period of Marshall's professorship at Cambridge from 1885-1908. Second, he considers not only the ideas themselves but the manner in which they became institutionalized in a professional conventional wisdom by means of new journals, new societies, new degrees and by making the recruitment of new specialists contingent on their having been filtered through the new dogmas. Maloney's book is not just a history of the years of high marginalism but an empirical study of the way in which intellectual revolutions give way to routinization and even ossification. The story is fascinating. It is well-told and written with style and elegance. The reader is barely allowed to recover from, "Marshall the moralist, dressed up as Marshall the economic biologist, egged on Marshall the ordinary citizen to speak out in public" before he is confronted with "To deprive was to deprave but some deprivations depraved more than others" (p. 200).

Maloney clearly has an encyclopaedic knowledge of his period. Not only are we provided with detailed notes on something like 40 British economists of the late nineteenth and early twentieth centuries but we are also treated to their private observations on one another. From Foxwell's correspondence Maloney gleans the rather pathetic reflection that Marshall welcomed assistance in performing the menial academic tasks that the great scholar despised, "but for the people who thus oblige I believe he has in his inner feelings a very honest contempt" (p. 226). A careful study of J. N. Keynes' diaries allows Maloney to point out that Keynes seldom took a daily newspaper;

seems to have been only dimly aware of the agricultural depression of the 1880s; came to see the foundation of the celebrated Economics Tripos as "a time-consuming bore" (p. 63); and never once includes Marshall's name on the lists (referring to a period of over 30 years!) he kept of his dinner-guests. An interview with Sargent Florence, who was in Cambridge for most of Marshall's retirement, produced the information that Florence only once caught a glimpse of the great man (at Kings Cross, it appears) and that Mrs. Marshall was quite capable of intercepting his post, assigning the matters arising to whomsoever she saw fit. Maloney has worked his way through Marshall's notes on something like 200 undergraduate pupils from 1895–1902. He looked up the review in the *News of the World* of 5 May 1900 of Hobson's *The Economics of Distribution*, and is obviously a man who knows his way around *The Grocer's Assistant* for February 1915. One must at least be grateful that no yellowing laundry lists or cancelled season tickets came into his hands.

No less interesting than the anecdotes and the facts, however, are the theoretical insights and the provocative questions. What are the intellectual links between utilitarianism, positivism, marginalism and liberalism? How could "an old gentleman who was never quite sure whether economic theory was impossible or merely undesirable" (p. 9) have been appointed to a Chair of Political Economy and could the same happen in an era of professionalization provided only that the candidate parrot the proper answers in the proper examinations? What are the relationships between social evolutionism, ethical neutrality and welfare economics? These are only some of the branches on which Maloney briefly settles before taking flight for some other part of the forest with which he feels the reader ought to become familiar.

The project is an ambitious one and it is clearly not possible for Maloney to do justice in so short a book to all the authors, evidence and issues with which he is concerned. His coverage is necessarily selective. Some readers will question the disproportionate amount of space that is given to Cunningham as compared with Ashley or Wicksteed; it is never made clear why such lengthy accounts are provided of

fringe figures such as Henry Dunning Macleod ("How did he manage to be quite so out of touch?" p. 133) and John Beattie Crozier ("a magnificently bad economist," p. 137); and Maloney was apparently not engaged by the debates either on policy issues (there is surprisingly little on education, poverty, taxation or pensions, for example) or on macroeconomics (even Hobson's views on underconsumption and unemployment are neglected, giving the rather misleading impression that nothing of significance was said in the age of Marshall on the state of the national economy). Nor does the book attempt international comparisons such as might show how the new paradigm influenced—and was influenced by—intellectual and professional developments abroad. And many will regret that Dr. Maloney does not include a detailed description of why an approach that began with such majestically holistic aspirations so rapidly degenerated into extensive specialization and extreme subdivision of labor. One hopes that Dr. Maloney will return soon to the period and produce further essays to fill the gaps. More generally, thanks to Professor Coats (who appears to have been an abnormally active and enthusiastic supervisor of the original Ph.D. the author of which this book is based), A' now John Maloney has made this topic in British economic history a more interesting to get the at

University of

*Towards the management*

*Treasury and the fiscal policy*

1930s. By ROGER MIDDLETON, London and New York: Methuen, 1985. Pp. ix, 244. \$49.95. ISBN 0-416-35830-6. JEL 86-0369

This well-researched study is an extension of Roger Middleton's Ph.D. thesis dealing with British fiscal policy in the 1930s. It constitutes a contribution to the new interpretation of the "Treasury View" of fiscal policy, as less of a pagan dogma retained with great social cost in spite of the contrary urgings of the prophet Keynes, but more of an understandable, if misguided, response by both politicians and administrators to what they perceived to be the main policy problems of the interwar period. The perspective is that of an historian who has

passed many days in the Public Record Office, but who is not afraid to venture into the economics literature, and even to run regressions. The author, however, is primarily concerned with the historical record, and only incidentally with the task of appraising the merits of competing economic theories. The competing theories are presented at a rather simplistic IS-LM level, thus missing the main thrust of the supply-side versus disequilibrium trading disputes about the interwar period currently raging amongst economists; at the technical level a D.W. statistic of 0.97 passes without comment (p. 206). The broader purpose of the study is to "demonstrate to readers that changes in official economic thinking rarely derive from theoretical considerations, though clearly they are informed by them" (p. 1).

The book is well organized. The introductory chapter outlines changing perspectives on the interwar British economy, ranging from the old pessimism, which saw the period as one of low growth, market coordination failures and demand deficiency; the old optimism, which perceived higher growth, more structural change and less demand deficiency; the new optimism which stresses high growth, efficient markets and benefit-induced unemployment; through to the new pessimism which largely preserves the old pessimism in the context of a disequilibrium trading version of Keynesian economics which has a "supply side" (the author's taxonomy is derived from the work of Steve Broadberry). The second chapter summarizes some of the main data on economic life in interwar Britain, discussing some of the accessory constructions which have been placed on the "facts." The following chapter deals with the administrative structure of the Treasury, outlining the major administrative obstacles to proceeding with expansionary demand policies such as those advocated by the Lloyd George platform in the 1929 election. Next is a chapter dealing with the revenue side of the often massaged central government accounts, which concludes that "whilst there was a reluctance to use the tax system in a discriminatory manner, it was firmly accepted within the financial departments that taxation was a potentially important instrument of economic management" (pp. 76-77).

These preliminaries over with, the next four chapters focus on the overall fiscal stance. The

theme of Chapter Five is that "while maintenance of balanced budgets was publicly expressed in terms of adherence to certain economic principles, in fact within government it was political considerations that were paramount" (p. 87). The next chapter outlines budgetary policy over the 1929-1939 decade, pointing out that "it was only with the advent of rearmament that the Treasury was to have recourse to deficit finance" (p. 115). Chapter Seven provides constant employment measures of the fiscal deficit over the 1930s, suggesting extensive changes in the fiscal stance, "a result not of attempts to stabilise activity by fiscal means, but from . . . striving to attain a balanced budget in the face of severe fluctuations in activity . . . and . . . the imperative of rearmament . . . from 1937 onwards" (pp. 134-36). The next chapter discusses the "Treasury View" in detail, arguing that this view did not implicitly assume full employment, as it often alleged; and that the crowding out of private by public expenditures argument against public works programs was based on the adverse psychological effects on financial markets that, it was thought, would ensue from higher government borrowing. The concluding chapter draws parallels between the debates of the 1930s and those of the 1980s: the "earlier episode illustrates clearly the strength of the political-psychological foundations of budgetary orthodoxy, the less than dominant role played by theoretical issues, and the ability of successive governments to avoid any commitment to wholeheartedly combating unemployment" (p. 189).

Overall this is a substantial piece of work which provides an excellent guide to original source material on policy debates in interwar Britain for both economists and historians. The author manages to present the *dramatis personae* to the debates in a manner recognizable in terms of the way their counterparts appear in public in the 1980s. My main reservation concerns the author's broad thesis that political and administrative rather than theoretical considerations dominated official economic thinking during the period. This thesis begs the question of why certain political and administrative considerations were perceived to be important, and does little to rebut Keynes' thesis that politicians and administrators, in such contexts, tend to "distill their frenzy" from some defunct

economist. The politicians and administrators in this volume appear as almost ahistorical characters living in a calm Whitehall or Westminster fishbowl that remained largely undisturbed until the advent of rearmament. The thesis that the "Treasury View" on crowding out was based on "psychological" considerations could also have been more firmly grounded if the author had spelled out the implications of rational expectations in the context of different views about the workings of economic systems.

#### 040 ECONOMIC HISTORY

*From new era to New Deal: Herbert Hoover, the economists, and American economic policy, 1921-1933.* By WILLIAM J. BARBER. Historical Perspectives on Modern Economics series. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. xii, 237. \$39.50. ISBN 0-521-30526-8.

JEL 86-0677

Herbert Hoover, Republican, had more in common with Jimmy Carter than with Ronald Reagan. Hoover and Carter were competent, optimistic engineers. President Hoover told a delegation seeking a public relief program in June 1930: "Gentlemen, you have come sixty days too late. The depression is over." He was overly optimistic! And yet, as William Barber convinces us, Hoover fought vigorously for public works programs and anticipated Keynes' theory of inadequate aggregate demand and even the liquidity trap. To him the government was lender of last resort. Of all American presidents, he is the only one with slums named for him—the "Hoovervilles." Policies Hoover designed were adopted during Franklin Roosevelt's first 100 days, but he ended his presidency being blamed for the debacle. Ronald Reagan, an optimistic actor, embraced "supply-side economics," a policy set doomed at inception, and led a willing people into the greatest economic decline since the one Hoover *did not* cause. Reagan was on the way to becoming perhaps the most popular president in polled history, a verdict in danger of being overturned by Iran-scram.

Barber provides a detailed account of Hoover's attempts to stabilize the American econ-

omy during his years as secretary of commerce (1921-28) and as president (1929-32) that also assesses the critical influence of his administration on New Deal policies. In so doing, Barber describes the model of a "new economics" to promote economic growth and stability formulated by Hoover and his associates in the 1920s. Barber considers the challenges to and critiques of the model: attempts at stabilization in 1929; Hoover's pre-Keynesian antihoarding campaign; the antithesis in the guise of orthodox neoclassical economic views of policy for 1932; Hoover's official 1932 model; and continuities and discontinuities in the transition to the New Deal.

Hoover, of course, was president before the invention of teflon. But, more than simply bad luck is involved. Most good engineers are very poor actors; most good actors are terrible engineers. I am generalizing, but usually engineers prefer detail and proof to showmanship. Worst of all for the fate of Hoover and Carter, engineers greatly prefer to plan than to sell. (Of course, this broad generalization extends to other roles in society.) As in the Horatio Alger stories of Hoover's time, good fortune depends upon admirable qualities and abundant luck.

The open-minded book will forever preserve Hoover's presidency and classical economic policy. Both Hoover and his associates were men of a small group. Ironically, Hoover's new Keynesian orthodoxy and the government's agricultural research heroes in Barber's story. Ultimately, Reagan's "supply siders" were rejected by Reagan himself as he pragmatically turned to Keynesianism (including military Keynesianism) at a time when the orthodoxy had come to bury it. Reagan succeeded where Hoover (and Carter) failed because Reagan created his separate reality with optimism, showmanship and idealism; then, he could alter "reality" (when required) with pragmatism. In this regard Reagan is a superconservative Franklin Roosevelt who shares his self-confidence and pragmatism. This helps to explain why FDR is Reagan's favorite president.

Even though Roosevelt belatedly accepted Hoover's proposed public works projects with

a similarly cautious fiscal policy. World War II (military Keynesianism) finally ended the Great Depression. Hoover had attempted to provide easy credit through the RFC (pp. 182–85), but failed to swing the Congress behind him. Roosevelt gained acceptance for the RFC within his initial 100 days. This Hooverian Roosevelt (bolstered by Roosevelt's wartime leadership) became a "great Democrat." Nevertheless, Barber reveals the surprising fact that Hoover had been out of office for five years before Roosevelt "fully reoriented" his sight toward an income and aggregate demand approach to economic policy (p. 194). It is uncommon for pioneers of ideas to gain quick acceptance. The safe path of the great uncoated who want instant recognition is to keep the new ideas secret for a decade.

The discontinuities discussed by Barber probably resulted from political necessity: Roosevelt could not look like a Hoover clone and still gain the support of Democrats in Congress. Barber effectively demolishes the popular—Keynesian and neoclassical—perception of Hoover as a do-nothing president. His failings—which Barber does not address fully—were related not to lack of vision or intelligent planning, but to ineffective political leadership. President Reagan understands what Hoover did not: an effective president points a nation in a clear direction and leads the electorate to understand why that direction is right even when it is wrong. Eventually, this country got much of what it most needed during the 1930s—Hoover's economic policy ideas and Roosevelt's remarkable political talent.

*The great merger movement in American business, 1895–1904.* By NAOMI R. LAMOREAUX. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. xii, 208. \$29.95. ISBN 0-521-26755-2. JEL 85-0945

Since the first major consolidation of independent business firms in the United States (the creation of the Standard Oil Trust in 1882), mergers have become commonplace. Indeed, they have recently been so much in the news that even nonspecialists are familiar with "greenmail," two-tiered offers, leveraged buy-

outs, poison pills, and with the \$11 billion judgment rendered against Texaco for interfering with a proposed merger between Pennzoil and Getty Oil.

In view of this, it is perhaps surprising to learn that there is no general theory of merger in economics or finance; instead, there is the general presumption among specialists that merger is motivated by a desire to maximize profits, and that it can contribute to this goal in myriad ways. Thus, individual mergers may be explained as attempts to realize economies of scale or of scope, to exert market control, to gain access to capital, and so on. This menu of reasons may be adequate for the explanation of individual cases, but a more general theory of consolidation is required to explain merger "waves," of which there have been four in the last hundred years (including the mid-1980s). Professor Lamoreaux's very important book offers a new general theory of the first consolidation wave (1895–1904), supports that theory with persuasive statistical tests and case studies, and explores the consequences of the mergers.

In the last quarter of the 19th century, modern business firms producing for a national rather than a local or regional market had begun to appear in the United States, but this growth was interrupted by the severe depression of 1893 to 1896. The first major wave of mergers occurred in its wake. Between 1895 and 1897 there were 10 major mergers; in 1898, there were 16; in 1899 there were an astonishing 63; the numbers then began to decline, falling to 4 in 1903. Most of these consolidations were horizontal mergers that resulted in great increases in market power. Such famous and still powerful corporations as U.S. Steel (now USX), International Harvester, and Pittsburgh Plate Glass were products of this wave.

There has been no consensus about the causes of this first merger wave. In general, scholars have not felt that attempts to gain market control played an important part in motivating the mergers. Instead, they have argued that fluctuations in stock market prices and the volume of trading were responsible (Nelson 1959) or that it was the result of attempts to secure efficiency gains, either in access to capital markets (Davis 1966) or to raw-material supplies (Chandler 1977).

Professor Lamoreaux's explanation begins

with the observation that the emerging big businesses of the late 19th century adopted one of two basic business strategies to minimize the adverse effects of competition and of unanticipated fluctuations in demand: either they manufactured small quantities of carefully differentiated, high-quality products, or they mass produced a cheap, homogeneous product. For example, the whiskey industry developed a segment that produced cheap, homogeneous "pure spirits" and a segment that produced high-quality, aged bourbon with a distinctive taste. Similarly, the paper industry divided into two segments, one that produced cheap wood-pulp-based paper and another that produced high-quality rag content paper.

The greatest advantage of product differentiation was that it did not require interfirm collusion. Each manufacturer's market was sufficiently narrow that prices and production could adjust relatively easily to changes in demand. The advantage of the mass production method was lower production costs.

The merger wave of the late 19th century was among firms that had adopted the strategy of producing a cheap, homogeneous product and had invested a great deal of capital in pursuit of this strategy in the 1880s and 1890s. Professor Lamoreaux argues that rabid price competition is more likely (and the benefits of horizontal consolidation are, therefore, greater) among firms for which fixed costs form a high proportion of total costs. Because of primitive accounting practices in the late 19th century, fixed charges would be burdensome only to firms that had recently borrowed to acquire capital. This suggests that in the late 19th century price wars were most likely to occur in highly-capitalized, common-grade-producing industries that had recently experienced a rapid growth followed by a sudden decline.

The author tests this hypothesis with a case study of two branches of the steel industry (of which one segment fit the profile of highly-capitalized common-grade production and the other did not) and with statistical tests of a broad range of industries. Both forms of evidence confirm the hypothesis.

Professor Lamoreaux then explores the consequences of the consolidation movement. In the short run, the consolidated industries were protected from ruinous price wars, as evidenced by their smooth sailing through the rough waters of the Panic of 1907. In the long run, the success of the consolidations at stabilizing prices encouraged entry into the industry, which then made the industry less stable. The only way to forestall this instability was to erect barriers to entry, for example, by vertically integrating to lock up raw material supplies, by patent pooling, or by inducing retailers not to carry rivals' output. Naturally, these actions posed new problems for the antitrust authorities, and Professor Lamoreaux details the connection between these attempts to bar entry and the ferment in antitrust policy before World War I. There is much that is new and interesting in this section (e.g., the discussion of the relationship between the movement for a federal incorporation law and the development of the rule of reason in the Standard Oil case in 1911).

This book is a model of good economic history and of good scholarship. Professor Lamoreaux has beautifully balanced a thorough reading of the history of the period with a plausible economic theory of it. It is a readable and certain that this work on the great merger century.

# 100 Economic Growth; Development; Planning; Fluctuations

## 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

*Aufsätze zur Wirtschaftspolitik* (Essays on economic policy). By JOSEPH A. SCHUMPETER. Edited by WOLFGANG F. STOLPER AND CHRISTIAN SEIDL. Tübingen: J. C. B. Mohr (Paul Siebeck), 1985. Pp. iii, 378. ISBN 3-16-844970-9.

It has almost become the established view of the oeuvre of Joseph A. Schumpeter that he punctiliously followed his principle, often proclaimed in his own lectures and writings, that an analyst, a theoretician, should sacrifice policy advice to purely academic work. Theoretical efforts should not be contaminated by contact with applied policy design so as not to endanger the *Wertfreiheit* of the former. The Stolper-Seidl collection shows that Schumpeter himself did not find it possible to resist the—after all, very understandable—temptation to violate this precept. Nor did this felicitous flexibility occur at the expense of the quality of economic policy advice: more than that proffered by many other economists is Schumpeter's based on extensive and original analytical work.

It is perhaps a trifle artificial to say (p. 4) that there has been a "gap in the documentation" of Schumpeter's political and economic policy output: that of the years 1916–32. His monetary essays, his two sociological studies "Imperialisms" and "Social Classes") and several others, by no means without references and allusions to current policies and politics, may be found in the three volume Schneider-Siehoff collection (1952–54) and its translations. But it is still true that Schumpeter's essays on Austrian and German politics and policies have not before been published in readily accessible collections. For this volume, which incidentally required considerable and meritorious detective work for the 1916–19 pieces, we are much in the editors' debt.

An instructive introduction of some 50 pages followed by three sections of roughly 100 pages each on fiscal policy, wages and employment policies, and on political subjects (including Schumpeter's financial program for 1919 Austria). While the two earlier sections of the

book establish Schumpeter as an insightful commentator on German economic policies of the 1920s, along lines that could perhaps have been expected of him, the third presents the documentation so far available, and rather recently discovered (Seidl 1982), on Schumpeter as a politician. Thus of special interest biographically, it sheds new light (together with the editors' commentary) on his political ambitions and on his personality. Even now, however, not all biographical puzzles have been solved.

The Austrian National Archives yielded the texts of three World War I confidential memoranda, written at the beginning of 1916 (after a German approach to the Austrian Monarchy for a customs union), at the end of that year (after the succession of Emperor Karl to Francis Joseph) and in April 1917 (the year of the most intensive efforts of the new emperor for a separate Austrian peace). While not addressing them to a particular person, Schumpeter gave them the widest possible circulation within a carefully chosen ("catholic-conservative") circle, principally of the Austrian aristocracy. The memoranda breathe throughout a fervent Austrian monarchical patriotism; they also carry an almost conspiratorial flavor. They aim at an Austrian Restoration, or rather at an imperial reformation, a "tory democracy" (after the English pattern), preceded by the formation of a new conservative party to be carried by the "historic families," the Austrian high nobility. Externally, this meant strict independence from Austria's ally, imperial Germany. It meant peace on Austria's (the ideal intermediary) initiative. It meant rapprochement to the Entente and the maintenance of close relations with the United States (which, though already at war with Germany, had not yet declared war on Austria)—Schumpeter fervently opposed any *Anschluss* which had found support among the German parts of the Monarchy, and any customs arrangement. Internally, it meant a beginning of a settlement of Austria's nationality problems (Karl's coronation at Prague) and a sort of Bismarckian social legislation. Settlement with Hungary, of which Schumpeter was as suspicious as of Germany, was to be postponed. Thus, the three memoranda represent a political program for a Tory revolution, with a new party, a new parliament, a new cabinet, not neglecting extensive efforts to influence

public opinion by forceful action and intensive publicity. Given the stage reached by Austria's history in 1916-17, these memoranda were perhaps a little desperate but by no means utopian and showed a shrewd analysis of social forces. All are argued with Schumpeter's well-known mastery of rhetoric and literary articulateness.

The biographical puzzle, of which the editors are aware but unable to resolve, is how it came about that less than a year after Schumpeter was still promoting his conservative program, we find him (1919) a member of the subcommission for the socialization of the German coal industry, and a month after that the minister of finance of a socialist coalition government in Vienna (the second government of Karl Renner). His principal supporters were two very well established socialists, Rudolf Hilferding and Otto Bauer (who, it seems certain, were ignorant of Schumpeter's wartime memoranda).

Schumpeter had at first been prepared to tolerate, and even to advocate, limited socialization, so long as (as for instance in the German coal case) it promised to raise efficiency and did not burden the budget of the state. But it soon turned out that Bauer's understanding of socialization of the Austrian economy went beyond what Schumpeter had advocated in Berlin and Bauer himself first in Vienna. The resulting clash remained unresolved. Schumpeter had been publicly accused of attempting to sabotage the socialization program by not blocking the sale to Italian interests of a packet of shares in one of the main Austrian mining and steel corporations. On this charge Schumpeter has been exonerated (see his letter to Chancellor Renner, pp. 337-343, and introduction, pp. 27-30).

A more serious disagreement arose over the question of the *Anschluss* to Germany (which had been part of the program of the Renner government), against which Schumpeter intrigued actively. But the peace treaty of St. Germain (July 1919) in effect forbade the *Anschluss*, and Bauer (the foreign minister) resigned (though he remained as head of the Austrian socialization commission).

Even though these two indications of Schumpeter's incompatibility with his cabinet colleagues stirred up a great deal of fuss, inside and outside the press,—and Schumpeter's unconventional personal habits did nothing to calm things—it seems that more solidly eco-

nomie disagreements led to his resignation in October 1919, after only seven months of service. His "Finance Plan," published on the day he resigned, eventually ran into unsurmountable opposition. A major contribution to economic policy at the time, it was a radically conservative stabilization plan for the Austrian economy ("Fundaments for Fiscal Policy for now and the next three years," pp. 345-68). It included a stiff capital levy as the instrument of absorbing the wartime, and inflationary monetary overhang; stabilization of the Austrian foreign exchange rate with a gradual freeing of external transactions; revamping the tax structure so as to encourage private investment and attract foreign funds (i.e., shifting the emphasis from direct to indirect taxes); central bank budget balance with sharp reductions of current outlay and the establishment of a new central with strict prohibition of credit to the government. In a word, a thoroughly modern program, capable of execution only by a very strong government—which the Renner cabinet turned out not to be. This policy plan has only recently received the attention it long deserved, in fact, it might well have served as a model for stabilization programs of the International Monetary Fund.

The essays present parts of the book. Schumpeter's to Harvard in 1932 tent undercurr them can be un in mind Schump requirements of success stages. And all of them can be understood from this point of view—a long-run vista in distinction to, but by no means unavoidably incompatible with, the short-run concerns of much of the English policy literature of that time. This contrast to Cambridge and Keynes has often been pointed out, and the editors do an excellent job in placing the essays in the proper perspective, it needs no further mention here. I would perhaps add only that his basic analytical model lends to Schumpeter's essays a calm, almost resigned patience which markedly contrasts with the turbulent politico-economic developments and disputes of the ten years of pre-Hitler Germany. It is no wonder, therefore, that Schumpeter's dispensation of advice

at times roiled the heated minds of politicians and economists (not excluding some of us fledgling initiates at the university)—on such burning questions as Reparations, tax reform, wage disputes and others.

There is remarkable technical detail in these essays: the analysis of individual types of taxation (sales, or value added, taxes, income taxes, inheritance taxes), one of the few systematic analyses of the role of central vs. local taxation (what in the German is called "Finanzausgleich," pp. 84–98), the limits of wages policy (pp. 192–201), the interpretation of the 1929–32 depression (with special attention to pre-New Deal American policies), etc. When it is kept in mind that the fundamental aim of Schumpeter's policy design was the rebuilding and strengthening of private investment, and of private saving, in interwar Germany, Schumpeter's proposals—pre-Keynesian, or perhaps better, post-Keynesian,—not only show the continuing power of the older verities of fiscal policy and wages policies, but also perhaps a surprising applicability to present-day problems. In this would seem to lie the reason for giving renewed attention to these essays. Schumpeter's strong critique of one-sided wage-push policies ("At length it must, and will, happen that employers and employees will sit down together to negotiate wages, capital formation and tax burdens *uno actu*," p. 41) shows this, as does his opposition to deflationary measures as a cure for the depression of the early 1930s. But these points have been forcefully made by Professor Stolper and require here only an appreciative mention.

What does need pointing out here is Schumpeter's strong belief that the success of economic policy depends critically on whether it is fitted to an adequately receptive historical state of social development, and his intense and—towards the end of the line of essays of the 1920s—increasingly deepening pessimism in respect of the survivability of competitive (classical) capitalism in the Europe of those days. His fear was (as he puts it in a review of Felix Somary's Heidelberg lectures of 1929) that "... the process of transformation which

our industrial constitution experiences more and more approximates—even without all the political interventions—a state of affairs which to call socialism or capitalism is a mere matter of taste" (p. 222). This view, more fully set out later in *Capitalism, Socialism and Democracy* (NY: Harper & Bros., 1942) is well enough known and has often enough been criticized as probably a simplification. Yet, the essays in the present volume show that it is perhaps worthy of wider application.

Were we to attempt to apply the principles of that policy [i.e., that of the late 19th century, e.g., of Miquel, Böhm-Bawerk, Gladstone] to the public finance situation of the Germany of today, we would proceed as someone who had observed a great physician successfully treat a case of cancer and then apply the same treatment to a case of tuberculosis. (p. 67)

The social structure which made the income tax the ideal financial instrument "is past, will never return" (p. 67). To be sure, these are strong pronouncements, especially when followed by

We must realize that social developments cannot be reversed and that a substantial reduction of the sum total of demands on the state is an illusion [to which he appends the footnote] this illusion is dangerous, just for those circles who love it. It leads to a dream life of fiscal policy, a fiscal policy as a great lie—to sham successes and sorry disappointments. (p. 69)

Perhaps too strong, but the whole of this essay on "Fiscal Policy" (1927, pp. 63ff) is worth re-reading. So are the essays on "Fiscal Policy and the Cabinet System" (1927, pp. 70–76) and "Spirit and Technique of Fiscal Administration" (1927, pp. 77–83), both no doubt inspired by his own bitter experience.

To repeat: we are indebted to Professors Stolper and Seidl for presenting us with this collection of essays that sheds light on elements of Schumpeter's work and personality that are not always adequately studied. Finally, a word of congratulation to the publishers is not amiss: they took only little more than three months from manuscript to publication.

## 120 COUNTRY STUDIES

*Growth, innovation and reform in Eastern Europe.* By STANISLAW GOMULKA. Economics of Technological Change series. Madison, WI: University of Wisconsin Press, 1986. Pp. x, 305. \$32.50. ISBN 0-299-10660-8.

JEL 86-0701

The East European and Soviet economies have a recent record fundamentally different from that of the first postwar decades. Their rates of growth are no longer much above the world average, their remarkable domestic stability is mostly gone and they have stopped making progress in catching up with frontier, i.e., Western technology. This rather sudden transformation calls for a fresh look at the overall efficiency of central planning. Stanislaw Gomulka here provides such a perspective, certainly the first extensive treatment of the issue in Soviet and East European studies.

This exciting book is organized into three parts. The first deals primarily with the comparative ability of central planning and the market system to promote technological change; it is mostly speculative in character. The second, basically technical, addresses the gradual deterioration of economic growth, and its primary force, technological progress. The third part discusses the abrupt failure of the import-led policy of modernization adopted by these countries in the early 1970s; it is largely empirical.

The discussion rests on a theory of technological change that relates changes in production to two sets of factors: systemic and nonsystemic variables. With the notable exception of the United States, representing frontier technology, the single most important nonsystemic factor for an economy is the relative gap separating it from the leader. The gap gives the follower an advantage, but certain systemic conditions have to be met to allow catching up to begin; and other, more demanding, conditions have to be satisfied to allow completion of the process. This said, a follower can grow faster than the leader, or indeed than any country that is more technologically advanced.

The main message of the first part is that the central planning machinery is not compatible with rapid technological change. The chief culprit is the soft budget constraints faced by

enterprises. Gomulka here adopts, with important modifications, the concept developed by János Kornai (1980), and widely adopted in comparative economics providing one of the book's best sections. For Kornai excessive use of budgetary financing tends to yield shortages of goods, but Gomulka sees low efficiency as the primary outcome; a statement I feel very comfortable with. Kornai argues that, whether prices are flexible or not, the centrally planned economies will end up with shortages, but Gomulka provides a theoretical proof that with upwardly flexible prices, shortages are avoidable, at least in consumer goods. Still, the question arises whether upward flexible prices are really compatible with central planning in any version. As long as the planners insist on directly allocating investment funds and making decisions on technological variants, it does not make much sense to permit prices of capital equipment to be flexible. Such flexibility will not do much good since managers counting on rescue by the planners whenever losses occur, are not very concerned with costs of production anyway. Prices of consumer goods could be raised to achieve equilibrium, but with production plans fixed by the authorities supplies will not necessarily adjust, and with the growth hunger of industry, capital goods will continue to receive higher priority anyway. Keeping prices of consumer goods stable ... compensation for short ... offer the workers

Gomulka argues the high degree of communist leadership in rapid technological change only tends to sustain competition, but also to ... Furthermore, as long as the ... in technology remains high, and the satisfaction of material needs is perceived by the majority as inadequate, innovation-conducive forms of economic organization will be desirable. From this it follows that technological change and economic policies must come into conflict. And so they have, even though the communist leadership, in its role as manager of the pursuit of the technological frontier, claims to promote values such as power, efficiency and success.

The second part, particularly illuminating, focuses on the slowdown in Soviet growth since

1961. The many economists who have dealt with this issue can be put in two groups. One claims that the source is the decline in technological progress, with capital playing little or no role (Abram Bergson 1979). The other argues that retardation results from difficulties in substituting capital for labor with the productivity residual remaining stable (Martin Weitzman 1972). Based on econometric tests of these competing hypotheses, Gomulka offers a new interpretation that accepts some of the assumptions made by the two groups but discounts others: many will find it very convincing.

Gomulka's approach departs from the others in that he tests a model with a new specification of the technological progress term. It attempts to capture the growth effects of two phenomena: the postwar recovery trend in technological progress, and changes in the annual number of hours worked. These two factors are variable over time and transitory, and superimposed on the third, constant term, i.e., a long-run trend in technological progress. The two variable factors, as Gomulka demonstrates, may alone have been responsible for the slowdown. Such other potential factors as the branch (i.e., sectoral) composition effect (i.e., related to shifts of labor from low- to high-productivity branches), the age-composition effect, and the diffusion effect (i.e., impact of imports of superior technology) he finds did not contribute to the slowdown, at least prior to 1975.

Nineteen seventy five is claimed to be another critical date in Soviet postwar growth in that the catching-up process virtually stopped. The Soviet economy may now have a so-called equilibrium technological gap, in the sense that, in the absence of serious systemic reforms, its position relative to the technological frontier would tend to remain the same. The book only suggests the above possibility, but Gomulka (1986) in his most recent work finds statistical evidence that Soviet productivity has not advanced on that of the United States for a decade. Even after allowing for characteristic overmanning and underutilization, Soviet technology appears stuck at least twelve years behind the U.S. level since 1975.

The third part of the book asks why western

credits and technology imports have not helped the Soviet Union and East Europe solve some of its economic difficulties over the last decade. Poland is given the most attention here, since its post-1979 collapse seems to provide the best evidence of failure. Gomulka measures the impact of technology imports and finds that they had a strong positive effect on productivity growth (1.5 point increase above the 5.7 percent postwar trend in 1974-1978). But with serious macroeconomic mismanagement, such as excessive wage increases, and lack of systemic reforms to provide incentives for efficient absorption of western machinery, the economy was doomed to accumulate excessive debts and collapse as it did.

My own interpretation (1986) departs from the present one on only one point. While I agree that Poland was fated to end up in a crisis with large debts, I believe that the depth of crisis is related less to the choice of growth strategy than to the regime's inability to institute an adjustment process since 1979. Political factors matter more than economic ones; the leadership does not have enough popularity within the country to mobilize workers, and it is internationally isolated so that badly needed fresh financing is not available (in contrast, Hungary has received IMF help). My guess is that under different political circumstances the Polish crisis could well have been no more severe than Hungary's.

*Models of development: A comparative study of economic growth in South Korea and Taiwan.* Edited by LAWRENCE J. LAU. San Francisco: Institute for Contemporary Studies Press, 1986. Pp. xxv, 217. \$29.95, cloth. \$10.95, paper. ISBN 0-917616-84-7.

JEL 86-0704

Three of the major questions in development economics are the following: What factors are responsible for successful development? Where the factor is an economic one, is it subject to policy manipulation? If so, is the policy transferable to other countries?

These questions are raised by Lawrence J. Lau in the introduction to *Models of Development*. In addition to Lau's introduction, the book includes a foreword by Nobel Laureate Lawrence R. Klein, chapters on economic development of Taiwan by Ramon H. Myers and South Korea by Sung Yeung Kwak, and a final chapter by Tibor Scitovsky that compares the development of the two countries. Since the mid-1960s a combination of high growth rates and low income inequality has made Taiwan and South Korea models of successful development. Myers and Kwak focus primarily on the economic characteristics of rapid growth in each country from 1965 through 1981, Scitovsky on similarities and differences in their performance. While the authors do not attempt to answer Lau's three questions explicitly, they identify significant economic factors in each country's development and discuss the policies employed to reach economic goals. Their work relates to Lau's first two questions but not to his third. This is hardly surprising since the transferability of policies to other, less successful countries should depend on institutional considerations as much as on economic ones. For example, many other countries are unlikely to have bureaucracies sufficiently adept and responsive to implement economic policies effectively. We have an economic model, in short, but no assurance that it can be replicated.

Myers mentions the reforms of the late 1950s, including devaluation and liberalization of trade controls, that marked Taiwan's switch from an import-substitution to an export-promotion strategy. This switch was followed by "The Transformation: 1965-1981" when overall growth accelerated, rapid industrialization

transformed Taiwan's economic structure, and industrialization was led by output of labor-intensive manufactures for export. The transformation was financed by unusually large savings, especially household savings. Myers traces these to a "cultural proclivity to save" (p. 19) and the high deposit rates offered by government-controlled banks (p. 52). Also discussed are the competitive nature of labor markets, land reform and early agricultural development, and the predominance of small-scale firms in industry and services. Of particular interest is the state-private sector relationship. The Nationalist government, though uttering the usual free-market shibboleths, inherited a tradition of state intervention that still prevails. State policy is skillfully employed to "... nurture the private sector by encouraging it to perform better" (p. 63).

Kwak's chapter on South Korea, like Myers' on Taiwan, begins with an outline of pre-1965 political and economic developments. He then explains the economic system where a "... combination of economic incentives and government decree has been effective in implementing policy" (p. 69), the development of agriculture and manufactures, and inflation, exchange-rate, and monetary policies. Subsequent sections examine foreign trade, labor markets, investment, foreign exchange, foreign aid, foreign investments, exports, and foreign debt. Coverage is more detailed than Myers'. Scitovsky's chapter covers topics that Myers and Kwak do not, such as monetary and financial policy. Scitovsky's approach is descriptive.

The chapters on Taiwan and South Korea reveal important similarities and differences. Scitovsky finds both score well on growth and equity indicators but close scrutiny shows that Taiwan has done better. This follows from differences in implementation rather than in policy aims. "The Taiwanese, ... unlike the Koreans, ... have shown great respect for the strength of market forces ..." (p. 145). Specifically, Taiwan adopted a market-clearing (high) interest-rate policy so that loans have been allocated by price, not by government policy as in South Korea. High rates encouraged the saving and labor-intensive production that in-

creased employment and reduced income inequality. Low rates in South Korea have created excess demand for loans. Loans are rationed, allocated to suit policy goals, and given mainly to large conglomerates with good records. Consequences for employment, income inequality, firm size, market entry, allocative efficiency, saving, and foreign debt have therefore been less favorable in South Korea than in Taiwan.

Though monetary policy may have been "the crucial difference between the two countries . . ." (p. 147), other factors clearly share responsibility for Taiwan's better performance. Lower income inequality, for instance, stems not only from an interest-rate policy that increases labor's national-product share, but also from better rural infrastructure and a more geographically dispersed industry that raise farmers' off-farm earnings. Also, comparison of two countries necessarily emphasizes their differences. If Taiwan and South Korea were compared in a wider context, their similarities would stand out, not their differences.

Among the shared characteristics that distinguish Taiwan and South Korea from other developing countries are their highly successful industrial policies. These are, according to Klein, similar to though not imitative of Japan's industrial policy (p. xiv). If we are to learn from models of development and answer Lau's questions, then it is necessary to focus on common factors like industrial policy that separate Taiwan and Korea from the rest of the developing world rather than on differences between the two countries. Such differences are fascinating, especially to specialists in the field, but it is the similarities that make the model and justify Lau's conclusion in which "it is hoped that this monograph will contribute to our understanding of the process of economic development" (p. 11).

*Indiana University-Bloomington*

130 ECONOMIC FLUCTUATIONS; FORECASTING;  
STABILIZATION; AND INFLATION

*Model reliability*. Edited by DAVID A. BELSLEY AND EDWIN KUH. Cambridge, MA and London: MIT Press, 1986. Pp. xiii, 244. \$30.00. ISBN 0-262-02224-9. JEL 86-0710

This volume represents some of the results of a five year interuniversity research project on model reliability. The aim of the project was to foster the development and communication of techniques for assessing the strengths as well as the weaknesses of econometric models. The latter theme has been persistent in the work of David Belsley and Edwin Kuh and many of the contributors to this volume over the past decade. The better understanding and use of such techniques may be an important ingredient in countering the low esteem that is currently accorded econometric research.

There are eight papers in this book, each touching on some aspect of model diagnosis or performance. There is no explicit organizing theme here, nor are new tools introduced: the techniques illustrated in the various contributions have been discussed elsewhere, some of them quite extensively. The chief value of the volume lies in its implicit theme: that the best way to learn about model reliability is to observe the model building and diagnostic approaches of reliable econometricians.

A paper by Clive Granger, R. P. Robins and Rob Engle discusses the specification and estimation of ARCH models. The acronym stands for autoregressive conditional heteroskedasticity and the idea is that the conditional variances of the errors may vary over time. The authors demonstrate that such models extend the notion of Granger causality to variances. The ARCH approach is illustrated with a bivariate model relating wholesale and retail prices. ARCH models are likely to play an important role in econometrics because many important financial and aggregate time series appear to

be best described by models with conditional variances that vary over time.

The analysis of residuals is also the subject of a paper by Jean-Marie Dufour who applies recursive residual analysis to test the stability of a demand for money function during the German Hyperinflation. This procedure is based on an analysis of prediction errors from a model that is estimated recursively. Various test statistics are then applied to these residuals to test for stability over time. Dufour argues that the advantage of this procedure is its exploratory nature: it does not require a precise alternative hypothesis about the nature of the structural instability. Unfortunately that is also a drawback as the power of the test against precise alternatives may be low and because the analysis in this application does not lead to any specific ideas for modeling the instability or improving the model to remove it.

Two papers deal with the use of prior information. Edward Leamer presents an interesting and witty Bayesian analysis of the determinants of inflation. Using a simple IS-LM setup he specifies a dynamic equation for inflation and one for unemployment. He characterizes Keynesian and Monetarist priors and conducts a Bayesian sensitivity analysis to examine the ambiguity in the estimates associated with ambiguity in the prior distribution. There is much to disagree with in Leamer's basic specifications—money is treated as exogenous, dynamics are introduced in a rather ad hoc way—but the beauty of this analysis is that all is laid out for one to see. Nothing is swept under the rug and the interaction of the data with the prior is made clear. The results and the conclusions are well worth reading. A paper by Mark Greene, E. Phillip Howrey and Saul Hymans explores the use of outside information to improve the forecasts from the Michigan Quarterly Econometric Model (MQEM). This is not a Bayesian framework; rather monthly observations on some variables are used to construct a pooled forecast that exhibits lower prediction standard errors than the MQEM forecast.

A paper by David Belsley considers the relationship between centering (measuring

variables in deviations from mean) and first-differencing and conditioning (collinearity) diagnostics. Although centering and first differencing often yield improved conditioning diagnostics, Belsley argues that they are meaningless. His view is that econometric relationships characterized in levels are structurally interpretable while those in terms of differences and deviations are generally not. This idea is at least arguable but the notion of thinking about identification in terms of the structural models of interest is certainly right. Stephen Swartz and Roy Welsch present a very useful survey and illustration of bounded influence regression methods—methods that assign less than equal weight to possible outlying observations—and illustrate some diagnostic tools that can be used with these methods.

The two final papers deal directly with the properties of large econometric models. Ray Fair and Lewis Alexander apply techniques developed by Fair for decomposing forecast error variances into portions due to error term variance, parameter uncertainty and model misspecification. They compare the decomposition of errors for the Fair model and the MQEM. Edwin Kuh, John Neese and Peter Hollinger present and illustrate an interesting method for linearizing and simplifying (reducing the dimensionality of) complicated nonlinear econometric models. The linear representations of the nonlinear models are of the fact that nonlinear models tend to be sparse and can be approximated by simple models. The method is applied to the MQEM.

Many valuable insights are provided in this collection. The book is so good that, in many instances, the authors' conclusions by application to models and equations that I find incredible and that the authors seem to feel apologetic about. I have much sympathy for Ed Leamer's conclusion that the most productive research program for macromodels is one aimed at honing their theoretical foundations.

THOMAS F. COOLEY  
*University of Rochester*

*Two crises: Latin America and Asia, 1929–38 and 1973–83.* By ANGUS MADDISON. Development Centre Studies. Paris: Organization for Economic Co-operation and Development, Development Centre, 1985. Pp. 105. \$14.00, paper. ISBN 92-64-12271-2. JEL 86-0718

During the first half of the 1980s the developing world—and in particular the Latin-American countries—suffered the worst recession since the Great Depression. In fact, the worsening of the terms of trade, drop in production, climb in unemployment, and inability to pay the foreign debt in the 1980s bring to mind the traumatic experiences of the 1930s.

This little book provides a tight and illuminating comparison of the two worst recessions experienced by Latin American and Asian countries in modern times. It originated as part of a project on the interdependence between the OECD and developing nations and is divided into seven chapters that cover both the general features of the two recessions, as well as the individual experiences of six Latin American and five Asian countries—Argentina, Brazil, Chile, Colombia, Cuba, Mexico, China, India, Indonesia, Korea, and Taiwan. In addition, a large number of statistical tables with information pertaining to the most important macroeconomic variables in these countries is provided. The comparison of these two recessive episodes is extremely revealing since it helps us understand how major external shocks are propagated under different institutional and economic structures. Also, the comparison across countries allows a better understanding of the extent to which different domestic policies help to minimize the impact of external shocks affecting small developing nations.

In his analysis of the 1930s in Latin America, Maddison emphasizes the role of monetary policies based on the gold standard in the transmission and magnification of foreign shocks. The initial worsening of the terms of trade resulted in very significant balance-of-payments deficits that generated large reductions in the quantity of money. However, most recent studies of this period, including Maddison's, have failed to point out that in a large number of countries the fiscal policy was equally, if not more, contractionary. At the time, most developing countries relied very heavily on taxes on interna-

tional trade—and in many cases on taxes exports—to finance government expenditure. The crisis, then, greatly reduced government revenues, and since macro policies invariably called for a strictly balanced budget, this implied an equivalent drop in government expenditure, generating additional recessionary forces. In other words, as a consequence of the macro policies the worsening of the terms of trade shifted back both the LM and IS curve.

As Maddison documents, the Latin American countries reacted to the 1930s crisis in different ways. After initially following the "rules of the game," the larger countries abandoned convertibility, and pursued active monetary and macro policies. Although the specific courses of action differed from country to country, an active exchange rate policy was followed by all of them and exchange controls, including import tariffs and quotas, were imposed. These protectionist policies marked the beginning of the import substitution growth strategy that was ardently embraced by most of the countries in the region. In his otherwise lucid analysis the author fails to discuss with sufficient detail the excesses and disappointments of the import substitution approach. Moreover, a shortcoming of his discussion of the 1930s in Latin America is the failure to draw a sharper distinction between macroeconomic and trade restriction policies. Although there is little doubt that the abandonment of convertibility and the implementation of active macro and exchange rate policies was desirable, there is equally no doubt that the imposition of massive controls on trade flows resulted in the creation of an inefficient and capital-intensive manufacturing sector that contributed little to growth and to the creation of employment.

Parts 4–8 of the book deal with the 1970 and 1980s. First, the characteristics and magnitude of the external shocks are analyzed. The author discusses how domestic policies affected economic performance in the different countries. Given the brevity of these chapters it is remarkable that the author is able to convey quite accurately, and in some cases with an impressive level of detail, the main features of these economies.

Perhaps one of the most salient lessons from the 1980s is the importance of exchange rate policies, and the usually staggering costs associ-

ated with overvalued real exchange rates. Four cases are particularly relevant here. First, the disappointing outcome of the Chilean experience with free market policies after 1973 was closely related to the adoption of a fixed nominal exchange rate at the same time as wages were fully indexed to past inflation. These policies, among others, helped generate a major real overvaluation that finally proved to be fatal. In Indonesia and Korea the adoption of an active exchange rate management—including periodic devaluations—were important components in overall strategies aimed at reducing the effects of world economic fluctuations. In that regard Indonesia's exchange rate and macro policies were quite successful as means to combat the Dutch-Disease effects associated with the oil boom. Finally, in Argentina the adoption of a declining preannounced rate of devaluation at a rate that was inconsistent with the magnitude of the fiscal deficit resulted in a loss of credibility in the government's policies and, eventually, in major capital flight.

In these chapters the current international debt problem is discussed. Maddison reminds us that contrary to the 1930s, when a large number of countries defaulted on their debts, in the 1980s we have not really seen defaults. Here the important role of multilateral institutions, and in particular of the IMF, is singled out. However, this discussion does not emphasize sufficiently the very different nature of the debt in the 1930s, when most creditors were bondholders, as opposed to the 1980s when a very large majority of the debt is owed to commercial banks. There is some evidence that, due to the greater degree of cohesion amongst banks than amongst bondholders, defaulting on bank loans entails higher costs than defaulting on foreign bonds (Edwards 1986). This explains, in part, why outright default has not been a real option in the 1980s.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

*Monetary conditions for economic recovery.*

Edited by CASPAR VAN EWIJK AND J. J. KLANT. Financial and Monetary Policy Studies, vol. 11. Dordrecht, Hingham, MA and Lancaster: Kluwer Academic, Martinus Nijhoff; distributed in the U.S. and Canada by Kluwer Academic, Hingham, MA, 1985. Pp. x, 338. \$48.00. ISBN 90-247-3219-0. JEL 86-0467

This volume is the culmination of an international symposium on monetary conditions for economic recovery held in Amsterdam in November 1984 to honor the retirement of Professor G. A. Kessler from the Faculty of Economics of the University of Amsterdam. The volume consists of the thirteen papers presented at the conference along with an opening address by Willem Duisenberg in honor of Professor Kessler, and an illuminating introduction by Caspar van Ewijk. It is organized in three sections. Part I contains five papers appraising the recent performance of national monetary policies in the United States, Germany, the United Kingdom and the Netherlands, all of them dealing with a wide range of different aspects of monetary policy. Part II, Finally, in Part III, to discussion of monetary policy experience for economic recovery and the course of monetary policy.

The past decade has witnessed a dramatic shift in the way in which central bankers think about monetary policy. As van Ewijk expresses it, "the Keynesian cum Phillips-curve consensus of the late 1960s" was effectively superseded by "the pragmatic monetarist consensus of the early eighties" (p. 6). The major focus of monetary policy changed from active aggregate demand maintenance to fighting inflation. In the latter half of the 1970s, this anti-inflationary emphasis was accompanied by a major innovation in the implementation of monetary policy: the practice of targeting monetary aggregates.

How successful have monetary policy and,

in particular, monetary targeting, been during the "monetarist experiment" of the early eighties? This is one of the main questions posed in the volume and is also an issue that has generated a lively debate in the existing literature. However, the controversy seems somewhat attenuated in the first section of this volume which may be a result of the fact that the authors addressing the problem all have some affiliation with a central bank. Despite the vague suspicion that one may be receiving a less than completely unbiased appraisal, all of these papers provide a valuable summary of the recent evolution of monetary policy in an environment fraught with constraints. Alexandre Lamfalussy sets the stage by describing some of the challenges confronting monetary policy makers in the 1980s such as persistent unemployment, high real interest rates, large U.S. fiscal and external deficits, currency misalignment, and financial deregulation and innovation. The limited ability of monetary policy to solve most of these problems seems to be a recurrent theme. Lamfalussy's main conclusion is that "one should not expect too much of monetary policy" (p. 37) beyond promoting disinflation through medium-term targeting, yet central bankers should follow a policy of practical flexibility in the face of shocks.

Stephen Axilrod provides a broad, informative review of U.S. monetary policy in recent years. He stresses the importance of the October 1979 shift in the Federal Reserve's operating procedures away from being primarily concerned with interest rates towards achieving goals for monetary aggregates. Axilrod points out that this regime change was crucial to increasing the credibility of the Fed's anti-inflation policy thereby reducing inflationary expectations. In his paper on the German experience, Helmut Schlesinger also describes the political and psychological benefits associated with using monetary targets to escape a vicious cycle of inflation and depreciation.

It is well known that the effectiveness of monetary targeting requires money demand to be a stable function of aggregate demand or at least one with well-understood and thus predictable shifts. Another necessary condition is the controllability of the money supply. Both Charles Goodhart, in his comprehensive account of British monetary policy, and Axilrod point to

the problems confronted by monetary authorities caused by episodes of unforeseen shifts in the demand for money or its various components. Goodhart's paper also provides a very good summary of recent developments, such as the removal of credit controls and various financial innovations, that have decreased the control of the money supply in the United Kingdom. In several Western nations, financial deregulation has caused the distinction between monetary and nonmonetary assets to become less clear, presenting central banks with the difficulty of choosing which class of assets to focus on for targeting purposes. M. M. G. Fase describes Dutch experience of using a liquidity ratio as the main indicator of monetary policy. He presents evidence suggesting that if the Netherlands adopted a Divisia Aggregate index as its definition of money for targeting purposes, it could make better allowance for innovations and financial change. Overall, I found Part I to be a valuable summary of the problems confronting monetary policy makers, ranging from unstable velocity of money demand to the rapidly increasing integration of international financial markets.

Part II is devoted to topics of international monetary coordination and is, in my opinion, the most interesting part of the book. It contains an excellent theoretical paper by Willem Buiter on anti-inflationary monetary policy in an open interdependent economy. In the framework of a two-country rational expectations model, Buiter finds that disinflation will entail costs in terms of foregone output and employment, except in the extreme case of perfect, classical, wage and price flexibility. While Buiter's model omits explicit consideration of government decision rules, strategic bargaining, and time-consistency constraints, it does provide several rich results. He finds that the social costs of reducing inflation can be mitigated by combining restrictive monetary policy with the proper mix of government spending and taxation and that, in some cases, international policy coordination can help.

This section also includes an empirical investigation of the European Monetary System's (EMS) experience with coordination by Paul de Grauwe. His paper indicates that although the EMS has reduced exchange rate fluctuations among members, it has not been success-

ful at insulating these countries from high world real interest rates, nor has it improved their growth and investment performance relative to non-EMS countries. Other papers include an analysis of the optimal exchange rate regime for the Netherlands by H. Jager and a description of the role of the International Monetary Fund in world monetary markets by Tom de Vries.

Part III contains four papers on lessons to be drawn from recent experience and implications for the future formulation of monetary policy. This is the first place that debate seemed to emerge. Nicholas Kaldor's paper stressed problems associated with the endogeneity of the stock of money and strongly attacked monetarism. Kaldor considers British and American monetary policy from 1979 to 1982 and concludes that the "monetarist experiment" was a "terrible failure" (p. 260). This section also includes papers by P. Korteweg and G. A. Kessler pertaining to Dutch experience and prospects for the future. The final paper by Emil van Lennep is a broad cross-country assessment of the proper monetary conditions for economic recovery which concludes that monetary policies cannot solve all the world's problems but can continue to contribute to price stability.

In general, this volume does not make major empirical or theoretical breakthroughs. However, it does provide a summary of a remarkable range of economic issues surrounding monetary policy in recent years, to which this review cannot do full justice. It makes a significant contribution in many areas and is likely to be of interest to economists and policy makers interested in theoretical and practical aspects of international monetary policy.

LINDA S. KOLE

*Board of Governors of the Federal Reserve System and University of Maryland*

*The economic function of futures markets.* By JEFFREY WILLIAMS. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. viii, 260. ISBN 0-521-26591-6.

JEL 86-1095

In *The Economic Function of Futures Markets* Jeffrey Williams seeks to reverse the prevailing view that futures markets exist primarily as a response to the need to shift risk (or to hedge). This view is widely held, among both

academics and practitioners. For example, the ability to eliminate price risk through hedging is commonly cited as the chief economic benefit of futures markets. Moreover, the commodity Futures Trading Commission, as a condition for approving new contract (futures) markets, requires proof of a significant hedging demand.

In attempting to replace this theory with his own, Williams has undertaken an ambitious academic project. His book, therefore, will be of interest only to readers who already possess a good deal of knowledge about futures markets, and who have some understanding of the scholarly literature in this area.

The paradigm put forward to replace the prevailing theory is that futures markets exist to serve as implicit loan markets for commodities. Hedgers, rather than attempting to eliminate the risks associated with commodity price fluctuations, really use futures markets to borrow and lend commodities. A short hedger, for example, who makes a spot purchase of a commodity and simultaneously sells a futures contract on that commodity is, in Williams' eyes, simply borrowing the commodity for a fixed period of time (while simultaneously lending money). The hedger's motivation is not a desire to eliminate price risk but to adjust his inventory stock.

A central aspect of Williams' theory is that firms hold inventories for the same reason that individuals hold cash, to avoid transaction costs. Further, the theory implies that commodity stocks are held to avoid price risk, or with volatility in mind, by firms that enter into futures contracts (just their stocks do not fluctuate in price). (Commodities) have a price risk which is managed by inventory management.

Williams' primary motivation for writing this book is his belief that futures markets exhibit characteristics that cannot be explained by prevailing theories. He contends, first, that empirical studies have demonstrated that futures prices do not exhibit any risk premia; and, second, that spread (price) relationships are highly variable. Without arguing whether he is correct about what empirical studies actually show, it is not true that the portfolio theory of hedging cannot explain these phenomena. In particular, futures prices will exhibit no risk premia when

there is a balance between short and long hedgers. Similarly, the volatility of spreads can be explained by shifts in the balance between long and short hedgers, or by changing risk preferences.

In summary, it is not clear that this book addresses any major deficiency in the prevailing theories of futures markets, or that it provides us with a superior paradigm for understanding their economic role. After finishing the book the reader is still left to ferret out for himself the importance of Williams' analysis. Does adopting the view that futures markets function as implicit loan markets change our understanding of why they exist and how they function to an important degree? Are there, for example, implications about price relationships that cannot be obtained from the prevailing theories? Are there implications about trading volume and open interest, or the volatility of prices, or about which commodities develop successful futures markets? Are there important public policy implications, such as how hedging should be defined and regulated, or what criteria should be used by regulators when deciding on new contract applications? Despite Williams' attempt to draw out some of these implications and to examine them in the context of the competing theories of futures markets (pp. 232-36), it is doubtful that any reader will draw the same conclusion: "... [that] the evidence supports one and only one theory" (p. 236).

Although the book fails to achieve its primary (and, indeed, very ambitious) goal of providing a new theory of futures markets, it may still be of interest to readers who wish to improve their understanding of "spread trading" in futures contracts. The author provides a careful analysis of such trading, as well as of the economic motivations for it. Another attractive feature of the book is Williams' impressive grasp of the historical evolution of futures markets. Finally, the book encourages the reader to rethink some of the fundamental theories and principles of futures markets.

FRANKLIN R. EDWARDS

Columbia University

## 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

*Untangling the income tax.* By DAVID F. BRADFORD. Cambridge, MA and London: Harvard University Press, Committee for Economic Development, 1986. Pp. x, 386. \$29.95. ISBN 0-674-93040-1. JEL 86-0763

David Bradford's *Untangling the Income Tax* is a truly first rate description and analysis of current and recent U.S. tax policy. It is also an excellent introduction to many of the major topics in modern public finance and, as such, will make an excellent supplementary text for courses in public finance. The book is about general issues in tax policy, and, while drawing on recent U.S. tax law changes for purposes of illustration, its contribution for tax analysis is separate from its insights into recent policy choices.

The book is highly readable; Bradford has accomplished the difficult task of writing on taxation in a way that will interest newcomers as well as old hands. Bradford blends together theoretical topics with a range of illustrations and examples. Many of these illustrations and examples will be new even to lawyers and accountants skilled in tax arbitrage.

Another reason the book will be of broad interest is that it examines U.S. federal taxation from two perspectives, that of a pure income tax and that of a pure consumption tax. The first perspective is familiar, the second is not. Since the U.S. tax structure represents a messy mix of income and consumption taxation, it can not be evaluated simply from the standpoint of income taxation. From that standpoint, for example, some features of the U.S. tax code, such as IRAs, may appear as unjustifiable aberrations, while from the perspective of a pure consumption tax they follow naturally. To my knowledge, this is the first book really to clarify the true nature of the U.S. tax structure and to compare the advantages of moving closer to a pure income tax with those of moving closer to a pure consumption tax.

The book begins by clarifying the differences between income and consumption taxation. It

also points out that the consumption tax can be imposed in a variety of ways, either explicitly through value added or retail sales taxes or implicitly by taxing income less investment; i.e., taxing income, but also allowing a deduction for new investment. The distinction between real economic outcomes and accounting labels is further examined in the second section of the book in which Bradford considers tax incidence. This section also considers tax distortions, saving and investment incentives, and tax simplicity. These topics provide a basis for critically comparing an income tax with a consumption tax and for evaluating the U.S. tax code. Such analysis is conducted in the course of presenting these topics as well as in the final section that deals with particular tax reform proposals.

The book is comprehensive and, consequently, long. The reader will find detailed discussions of what may be called major minor issues such as the tax treatment of durables, the treatment of capital gains, depreciation, and the interaction of inflation and taxation. Bradford moves from one issue to another in a fluid manner, but in becoming engrossed in the sub-topics one has occasionally to stop to think how each of the pieces relates to the main puzzle. In addition to a few more connecting paragraphs I would also have preferred that Bradford take a stronger position supporting his preferred tax reform. I think this would have helped better to focus the book, but it would have distracted from its scholarly and objective approach.

In sum, this is a book that I highly recommend to undergraduate and graduate public finance students, to tax scholars, and to tax practitioners.

LAURENCE J. KOTLIKOFF

*Boston University*

[PEACOCK, ALAN] *Public choice, public finance and public policy: Essays in honour of Alan Peacock*. Edited by DAVID GREENAWAY AND G. K. SHAW. Oxford and New York: Blackwell, 1985. Pp. xi, 219. \$45.00. ISBN 0-631-14313-0. JEL 86-0144

The dozen papers collected in this festschrift reflect the honoree's diversity of interests, united by a concern with applied economics and public policy. Many of the papers are brief surveys of an area of public sector economics

or political economy. These surveys are technically undemanding and appear to have been written with the nonspecialist in mind. Those familiar with the subject matter of the survey area will find little that is new here, but the general reader may well profit from the quick overviews these essays provide. The volume also contains several research papers, though most of these also have an emphasis on exposition and synthesis.

Richard Musgrave traces the development of three strands of thought relating the philosophy of social justice to the redistributive role of the public sector. These include Locke's theory of entitlement based on natural law; utilitarianism and its "new welfare economics" reformulation; and the notion of justice as fairness, as currently associated with the work of John Rawls. Each of these ultimately runs into difficulty in dealing with some aspect of application (e.g., Lockians have problems with the role of income from capital or inherited wealth). Nonetheless, Musgrave argues that cogent public policy must ultimately be based on a set of ethical judgments that cannot be derived from economic reasoning alone. This is of course correct. But it is unlikely that the polity of a complex society will long be in agreement on the desirability of redistributive policy, let alone the merits of progressive taxation or a substantial retreat from free-market orthodoxy.

In another survey, Charles Blaug looks at the development of the public sector in England about marginal cost pricing. Blaug's argument applies to regulation of public utilities, covering most of the theoretical ground. He makes a forceful argument in favor of returning at least the spirit of marginal cost pricing in public policy. He views this spirit to be, in essence, the economist's insistence that efficiency considerations be accorded a serious place in the policy debate. In a political arena that is often driven by redistributive contests, Blaug sees the economist as "a special custodian for society of the efficiency view of economic problems, because all the evidence suggests that, if economists do not draw attention to the trade-off between efficiency and equity, no one else will" (p. 27).

A brief introduction to the economic theory of public sector bureaucracy is provided by Charles Rowley and Robert Elgin. The central feature of the organizations of interest is that

"profit" (or the difference between revenue and cost) cannot be directly appropriated as income by employees or "owners." Moreover, they are subject to review and control by political institutions. The main concern of this literature is not so much the internal workings of these bureaucracies. Instead, the focus is on how the special constraints and incentives they face affect their economic choices (inputs, outputs, and—sometimes—prices).

For those who are unfamiliar with the standard works in the area, particularly the writings of Niskanen, this is a useful primer. Rowley and Elgin do a good job of stating the central assumptions and results of the various models and discussing their shortcomings. They make an argument for shifting the analytical framework away from the style of the models they discuss, towards a principal-agent theory of the connections between legislative bodies and the public sector bureaucracies. This is indeed the direction of much current research.

A quick glance at the behavior of international agencies is provided by John Williamson. Based largely on his experiences at the International Monetary Fund, he conjectures that at least some international bureaucracies are "presumptively wise rather than presumptively self-seeking" (p. 168). By this he means that they are more likely to make technocratically-based decisions than to be motivated by narrow bureaucratic or political concerns. Specifically, in the case of the IMF and possibly the World Bank and OECD as well, he argues that technically sound economic arguments have considerable force because they are judged for the most part by other economists. Moreover, the political goals of any single government are unlikely to dominate agency goals.

Williamson does not provide an analytical framework whereby his conjecture can be tested, but his claim points to an intriguing research agenda. I do not know whether international agencies do indeed make "better" economic decisions than domestic ones. Certainly, the two types of agencies face quite different environments. I find it instructive, however, that similar claims have been made about *their* agencies by economists who have worked at domestic U.S. bureaucracies such as the Civil Aeronautics Board, the Interstate Commerce Commission, and the Federal Trade Commis-

sion. It seems that once a sufficient number of economists were appointed to these agencies, economic rationality began to take the upper hand, and policy making became more reasoned and less prone to the push and pull of political interests! Hence the deregulation of surface transportation and telecommunications, and the retreat from antitrust activism.

Other surveys are provided by Maurice Peston on macroeconomic policy effectiveness and by Herbert Giersch on the relationship between exchange rate movements and economic development. Francesco Forte uses results from the theory of social choice to analyze the voting rules of decision-making bodies of the European Economic Community. There are also papers on the economics of the performing arts (Hilda and William Baumol); the use of forced loans as a policy to induce saving (Anibal Cavaco-Silva); on whether having taken economics courses in secondary school improves performance in beginning university economics (it does, at least in the U.K., according to Keith Lumsden and Alex Scott); and two papers on recent developments in the British welfare state (by Alan Williams and by Thomas Wilson).

## 400 International Economics

### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

*Economic policy in an interdependent world: Essays in world economics.* By RICHARD N. COOPER. Cambridge, MA and London: MIT Press, 1986. Pp. xii, 340. \$27.50. ISBN 0-262-03113-2. JEL 86-0781

This volume brings together eleven essays first published between 1971 and 1985. They focus on problems of formulating macroeconomic policy in an environment where labor and capital are increasingly mobile across national boundaries, and the economy is subject to shock by external economic forces. The analytical framework is for the most part that of a demand-driven macroeconomic model, with foreign trade in goods and securities. Inflation is explained either by the reaction of economic agents to external increases in the prices of raw

material imports, or as the effect of increases in the price of foreign exchange on the domestic price level. There is no attempt to integrate theories of domestically originated inflation into the analysis, and indeed, inflation does not even receive an index citation!

The author's perspective is that of a rational, publicly spirited civil servant, prescribing policies of economic stabilization through techniques of demand management, monetary policy, and occasionally direct control. The domestic economy is destabilized by the random, irrational, or perverse actions of private individuals, corporations, and foreign governments. It must be stabilized by government, despite the frustrations imposed by the openness of the international capital markets. There is no sympathy for the view that the U.S. government is itself a chief source of economic destabilization, and little attention paid to examples such as the financing of the Vietnam war or Nixon's 1971 New Economic Policy. Indeed the author suggests (p. 68, n. 9) he may have originated the term "locomotive theory," which is a rationalization of a Carter Administration inspired macro shock of the late 1970s.

Where the essays shine is in the author's command of policy issues and the problems of formulating coherent structures of economic alternatives under the short-run constraints necessary for decision making. A good example of this capacity for creating a coherent structure is the essay "Global Economic Policy in a World of Energy Shortage," written in 1980, just a year before the collapse of the world energy market and the marked decline of inflation in the U.S. It reflects the authors' experiences as an Undersecretary of State for Economic Affairs in the Carter Administration. He presents an insightful description of the macro effects of OPEC's price policies on the global economy, and the lessons learned in reacting to its destabilizing influence on the payments balances of oil importing countries.

The essay is also an example of the weaknesses inherent in much of the policy formulation of the period. It treats inflation as an act of the Ayatollah (not the chairman of the Federal Reserve), and argues for an active energy policy, for without it, we will have "higher-than-necessary rates of inflation and lower-than-desirable rates of growth" (p. 67).

Many of the essays belong on a reading list, for their clear analysis and synthesis of significant historic events. These include "Managing Risks in the International Economic System" (1981), "Monetary Theory and Policy in an Open Economy" (1976), "An Analysis of Currency Devaluation in Developing Countries" (1971), "Economic Interdependence and Coordination of Economic Policies" (1985), and a paper written jointly with Jeffrey Sachs, "Borrowing Abroad: The Debtor's Perspective" (1984).

The last-mentioned essay is noteworthy for the lucid combination of theorizing and policy conclusions, all relevant to the current stalemate between international borrowers and lenders. The first part of the essay is an original analysis of the incentives and costs of debt repudiation. A Nash-equilibrium framework is employed to solve for a payoff schedule in which the fraction of the debt repaid depends on the creditor's ability to impose penalties on the debtor including the seizure of assets. The analysis then proceeds to study optimal borrowing choice with and without liquidity and repudiation risks. The presence of such risks is cited for the inability or unwillingness of debtor countries to acquire as much debt as they would like to be serviced.<sup>6</sup> The inquiry then turns to the externality of the presence of such risks with strong but only partial internalization.

In many cases the action is taken by an individual agent rather than by the government regarding the credit worthiness of a country as a whole. Most potential creditors are unable to discern the ultimate causes of a default and, in particular, whether the action reflects the weakness of a particular debtor or is instead a signal about government policy and economic health in the whole debtor economy.

The implications of this spillover are immediate. First, governments—even the most *laissez faire*—must assume some responsibility for honoring the external obligations of bankrupt firms in the private sector. Second, creditors act on the expectation of such actions, and indeed may withdraw credits from countries when such actions are not forthcoming. Naturally, therefore, a government must at the minimum undertake the prudential supervision of private-sector foreign borrowing in order to safeguard the economy's international creditworthiness. In some cases, it may be necessary to make government

backing explicit to facilitate the appropriate levels of inflow. (p. 258)

In other words, a free capital market, left unsupervised, will produce too low a level of borrowing. A number of comments are suggested: First, some borrowing countries may have placed *excessive* reliance on debt as the vehicle for capital importation because of restrictions on foreign equity investment. In these cases, the screening mechanism called for is already in place and is the source of an overreliance on debt, not the solution to the externality identified by the authors. Governments of underdeveloped debtor countries rarely need an excuse to monitor the investment or borrowing policies of private entities that are large enough to be considered credit-worthy in the international capital market. The need is to relax government supervision, eliminate the opportunities for rent gathering, and prevent government guarantees that transfer wealth from the country's taxpayers to its foreign creditors. Secondly, the conclusion ignores the likelihood that large scale defaults (debt rescheduling) in a developing debtor country are the result of government policy, and that the chief defaulters are likely to be government-owned corporations. The analysis thus overstates the problem of reading obscure signals of future government policy. Finally, I wonder whether the authors would extend their prescription to the management of our own economy, now that it is promising to emerge as the world's largest international debtor.

*Brown University*

*Structural conflict: The Third World against global liberalism.* By STEPHEN D. KRASNER. *Studies in International Political Economy*. Berkeley and London: University of California Press, 1985. Pp. ix, 363. \$24.95, cloth; \$8.95, paper. ISBN 0-520-05478-4, pbk.

JEL 86-0501

In this book Professor Stephen D. Krasner applies a novel approach to analyze North-South relations. He terms the received view "economistic," which allegedly explains conflicts between the North and the South in terms of the latter's slow economic growth, poverty and ignorance and which presumably sees

Third World behaviors being motivated by economic gain. Krasner challenges this approach, instead characterizing North-South conflicts in terms of the profound disparities of power and wealth between the industrial nations and the Third World states. The book consists of three main parts. The first part develops the argument. The second discusses a number of issue areas while the last part contains a lengthy analytic conclusion with prescriptions for Northern policy.

Krasner traces the development of present North-South relations to the post World War II situation when the major powers established the United Nations and endorsed the principle of sovereignty. This development led to the creation of more than seventy-five sovereign states and the one-country/one-vote system at most international forums. Domestically, most of these states are limited in material resources, weak in their social and political structure, and as a result, are vulnerable to external threats. But collectively, they are capable at these forums of challenging the prevailing norms of the international system.

The book is a useful contribution to understanding North-South relations. It explicates in great detail the perspective of viewing Third World behaviors in terms of their attempt to manipulate the rules of the game in international relations. According to Krasner, the conflict between the North and the South is essentially one between regimes; he defines a regime as a set of principles, norms, rules and decision-making procedures which coordinate behavior, and around which actor expectations converge (p. 60). As a whole, the North upholds a regime of "liberal, market-oriented principles" while the South advocates an antimarket "authoritative" regime. The Third World countries reject the market-oriented regime because they are painfully aware of their weak positions in the international system and of their vulnerability to external shocks and pressures. On the other hand, an authoritative regime would enable these countries to reap both wealth and control. Krasner believes this framework better explains the strivings of Third World nations toward a new economic order and their willingness at times to sacrifice wealth for control. He substantiates this thesis with case studies of the international regimes affecting international fi-

nancial institutions, multinational corporations, the global commons (Antarctica and the Oceans), and transportation. Since weakness and vulnerability will persistently characterize these Third World countries, Krasner also sees the North-South conflict as inevitable and hence the title of the book, *Structural Conflict*.

But the analysis of Third World behavior at the abstract level of regime choice is not without its risk and cost. Krasner has to dismiss a number of important exceptions or counterexamples. Countries such as China and India with their huge populations and territories are excluded from the generalization. Small prospering states like Hong Kong, South Korea, Taiwan and Singapore which rely heavily on the market mechanism and on symbiotic relations with the industrial world are lightly treated. No convincing analysis is given as to why other Third World countries could not emulate such success. As a matter of fact, the latter countries that Krasner takes as exceptions are precisely those that have gotten out of their weak position partly because they have adopted the market mechanism to a far greater degree than other Third World countries.

Nor does the adoption of the authoritarian regime explain all Third World behavior. In the international regime for shipping, the Third World quest for restructuring the flags of convenience system is resisted by Liberia and Panama out of sheer self-interest (p. 224). Chile and Argentina, which both have sovereignty claims with regard to Antarctica, are adamantly opposed to having the region placed under the common heritage rubric (p. 261).

Perhaps the most serious challenge to Krasner's thesis is that it is cast in essentially "rationalistic" terms, thereby lacking a "micropolitical" foundation. Clearly, there are other important factors that might explain the behavior of Third World countries, e.g., conference diplomacy tactics, the sociology of Third World representatives at international forums, group politics that prevail among Third World leaders, the private benefits an authoritative regime might confer on the generally corrupt bureaucracy of Third World governments, Soviet agitation, etc. Apparently eager to take Third World claims at their face value, Krasner gives little credit to a wide array of real-life factors that

might also account for Third World behavior at international conferences.

Krasner does not stop at expounding the thesis of regime conflict. He attempts at times to elevate the discussion into a paradigmatic debate between the "economistic" and his "realist" reading of North-South relations. While one could readily be in agreement with his challenge of "economistic" interpretations which ignore the role of power, the state, etc., one could hardly subscribe unequivocally to his alternative built largely upon the ex post rationalization of different cases with definite and known exceptions. Without offering a viable alternative, Krasner is open to the charge of setting up a straw man against which he does not seem to have the resources to compete. Since he, too, acknowledges, at a point, that "most aspects of North-South relations are consistent with both modified realist and economistic interpretations" (p. 313), it is doubtful if the distinction serves any useful purpose.

#### 430 BALANCE OF PAYMENTS: INTERNATIONAL FINANCE

*The IMF policy paradigm  
of stabilization  
economic dev.*

DAVID. New York,  
Toronto and Sydney  
1980. \$34.95. 150

The appropriateness for developing countries is examined by Wilfred L. David in his new book. His concern is that these policies, which evolved from a concern with macroeconomic stabilization, and are based as he sees it on a philosophy biased towards market-oriented solutions and against public sector involvement, are inherently incapable of solving developing country problems. Indeed, incompatibilities between short-term liquidity-payments balance policies and long-term structural-developmental policies predate the founding of the IMF and World Bank and help explain the original allocations of responsibilities to the new organizations.

Professor David sympathizes with the complex problems faced by smaller developing

countries and is highly critical of the inflexibility of IMF lending policies in addressing these complexities. He feels that this inflexibility is explained by the theoretical framework within which IMF functionaries work; this latter he describes as the "orthodox paradigm," the result of the theoretical backgrounds of IMF policy makers. To establish the existence of this paradigm he develops a general taxonomy of the assumptions, methods, major conclusions, and resulting implications of the Radical-Heterodox, Neo-Keynesian, Keynesian, Neoclassical, and Monetarist-New Classical schools (his categorization). He notes that, in spite of the diversity of these schools, strong elements of commonality exist in their views on the desirability of efficient resource allocation and the dependence of economic growth on the extent and speed of capital accumulation, with each of the latter dependent on freely functioning national and international markets.

The author next moves to an exposition of demand management policies, development and growth processes, and monetarist perspectives on these policies and processes, always being careful to relate his discussion to conditions in a developmental context. Here he develops a very useful schema for classifying and analyzing the impact of various macroeconomic theories and their related policy recommendations on developing economies. His next concern is with recent trends towards still greater emphasis on market-oriented decision making in the international sphere. He cites and discusses the economic evidence on the impact of exchange rate and interest rate policies in developing economies, and, while fair in his presentation of theories underlying "the new orthodoxy of trade and financial liberation," he finds that these policies are based on theories that generally assume conditions not relevant to the developing countries.

Professor David attempts several tasks in his short critique, some of which, while very interesting, are peripheral to his main concerns. His attempt (noted above) to provide a general taxonomy of economic characteristics and relevant policy conclusions of major economic schools is in this category. His ongoing evaluation of general relationships between short-term stabilization/adjustment and long-term adaptation/developmental policies is much more success-

ful, although repetitive and lacking somewhat in organization. Least successful is his evaluation of the respective roles of states and the private sector in developmental policy. What is desperately needed is a classification and evaluation of contributions and potential contributions to resolution or amelioration of the DC's problems. The adaptations made by the IMF to the special needs of the DCs are recognized by David; however, he spends little time on them, seeing them as pragmatic responses within the umbrella of the paradigm, with little potential for success due to the accumulation of developing country debt and the relatively recent swing to stricter application of market-oriented performance criteria. Left unexamined by this study are truly innovative proposals to ameliorate the international debt problem, such as regional, sectoral or functional economic integration, IMF (or other agency) sponsorship of pooled and centrally-managed reserves, and even SDR creation linked to reserve needs.

One may sympathize with David's position and even agree that the new U.S. initiative to stimulate flows of adjustment financing to the DCs does not represent a significant departure from past policy, and that much more innovative solutions are in order. But a critique of *The IMF Policy Paradigm* should offer some recommendations for change.

EDWIN H. FLYNN

*Augusta College*

*External debt rescheduling.* By ROLAND PLAN. Law, Economics and International Trade series, vol. 8. Vienna: Manzsche, 1985. Pp. x, 276. Paper. ISBN 3-214-065572.

JEL 86-0799

Roland Plan has contributed a useful volume on *External Debt Rescheduling*. For the practitioner involved in the many rescheduling exercises, it summarizes in thoughtful fashion the great diversity of experience of recent years. Even those engaged steadily in these exercises tend to know well those cases in which they participate and know less systematically the many other cases. It is helpful to them to read a thoughtful summary of the entire process and experience. For those who have not been involved in the cases of Poland and Mexico, the more detailed case studies on these countries will be particularly welcomed. For the student

of international economics and finance, it will provide the needed background for understanding what has been happening in external debt rescheduling. Much has happened since the volume was completed, but this does not diminish its usefulness.

The volume approaches the many issues in external debt rescheduling with a focus on the lending institutions. The selection of topics for detailed review and issues such as the distinction between "country risk" and "sovereign risk" and the consequences of debt rescheduling are essentially how they appear to lending institutions. It examined, for example, the implications of debt restructuring for balance sheets or regulatory rules. In this respect the book follows the conventional wisdom of the last decade. Everywhere the external debt problems of developing countries have been viewed as important and urgent because they seemed to threaten major financial institutions and, through the domino effect, the international banking system. Efforts to define the external debt crises as a crisis of development or developing countries were given polite attention only. Analysts and practitioners followed the media in reveling in "what if," worst case scenarios with consequent horror stories of international financial collapses that translated into major bank failures especially in the United States. Development economists and officials gave more attention to conditions in developing countries, but also used the "what if," worst case scenarios to bolster the more traditional arguments for development assistance. Adjustment programs were rationalized on the grounds that IMF approvals were needed to obtain favorable debt restructuring from the creditor banks and new money from official and private sources. Many commercial banks reacted to the events and analyses of recent years by withdrawing from lending to Latin America and other countries, thus dispersing the international financial crisis. I believe this withdrawal was shortsighted and reflects an inadequate appreciation of the borrowing national economies taken separately, or the global economy as a whole.

Having been in bright lights and strident publicity for years, the public expects the external debt problem to be presented as a Greek tragedy with valiant efforts to prevent the other-

wise inevitable disastrous doom. It is not enough to summarize, as Roland Plan does, the suggestions of others and to make rather mild suggestions like proceeding on a case-by-case basis and linking a country's financial obligations to its export performance. A jaded public needs lurid tales to hold its attention. I fear this may also be true of academic readers. I hope not, because Plan's book merits attention.

Plan's volume emphasizes what has happened. Whatever happens in the future will be highly conditioned by the events he describes. Those seeking novelty and thrills would do well to read this book to ensure that what they think and propose has the benefit of historical experience. If they do, they may well find it necessary to go more deeply into historical experience, but now fortified by the knowledge and systematic thinking contained in the book. I hope Plan will not lose his interest in developing countries, but will go on to explore deeply the many areas of international capital movements that await the serious student.

#### 440 INTERNATIONAL INVESTMENT AND FOREIGN AID

##### *External debt in Latin America*

*policies and ren-*

CHU, ROBERT L.

Boulder, CO.

the United Nations

for Latin America

Pp. viii, 125.

Bank lending to Latin America has trickled after the middle of 1982, following Mexico's by now well-publicized payments difficulties. The ECLAC study, prepared in 1984, is part of the flood of literature examining the debt problem. In analyzing the debt crisis and early efforts at its resolution, the book emphasizes three aspects: external shocks, domestic adjustment policies, and banks' lending decisions and the renegotiation process.

The study opens with various statistics on the external environment and the Latin American balance of payments. It cites slow growth in the industrial countries, protectionism, a deterioration in the terms of trade for nonoil de-

veloping countries, and the high cost of credit as the external factors causing the crisis. Nonetheless, the day of reckoning might have been postponed had the inflow of funds not dried up—much of the new lending since 1982 has only covered interest payments on old loans.

Next the study cites four domestic causes of the debt problem. First is the decision to pursue a strategy of using foreign funds to fuel domestic economic growth. Second is the rapid and contemporaneous increase in domestic expenditures. Third is the unexpectedly slow progress toward stabilization that exchange rate policies yielded. Finally, the liberalization of domestic financial markets interacted with these other factors to generate high real interest rates.

The authors follow with a discussion of the renegotiations. As is well known, the spread on loans (that is, the markup over the banks' cost of funds, as measured by the prime rate or the bid rate on Eurodollars) increased after 1982 for virtually all Latin countries. This caused great handwringing. But it is at this point that one sees how rapidly studies of the debt problem become dated. Even at the time this study was written countries were gradually extracting better terms from banks: lower spreads, longer grace periods, and longer maturities on renegotiated loans. Regardless of their ability or willingness to pay, countries only had to show up for the rescheduling "game" to garner better terms. Further concessions have since been made, including concessions on the amount of new loans, although banks remain reluctant to provide new loans in excess of the interest payments due. The Mexican negotiations of 1986 almost shattered that barrier.

The authors conclude that adjustment and debt renegotiation were very costly, citing a fall in imports and domestic growth without any improvement in inflation, while the cost of financing increased even as the amount of new funds available decreased. They then go on to offer policy recommendations, which seem to point in the right direction. They acknowledge that fiscal and monetary policies were too expansionary, and that greater efforts must be made to export. But other suggestions bear a distressing resemblance to the policies that first caused Latin America's difficulties.

They favor expenditure switching over expenditure reduction (particularly construction investment over plant investment) because of the lower import requirements, without adequately assessing the value of the investment; they advocate a monetary policy that would too easily accommodate inflation expectations; there is a questionable reliance on incomes policies to reinforce (almost supplant) monetary policy; and their arguments for promoting net exports suggest the use of differential exchange rates in place of tariffs. Theoretically such policies could yield good results. However, the Latin American record shows that they rarely remove the economy from its straitjacket for a long period of time, but only embed a new set of interest groups in the political system. Also, the terms on rescheduled loans are already more favorable than those suggested by the authors, although the percentage of interest payments refinanced still falls below this study's suggested ratio of 80 percent.

Several topics are underemphasized in this book. Capital flight plagued the region, with much of the outflow a perfectly legal response to misguided exchange rate policies. Several countries have rather minor amounts of net foreign debt, though the gross debt figures are large. Moreover, one reason the sharp swing in net inflows of funds was absorbed so well was that capital flight could be reduced without affecting growth directly. Trade policy is also discussed too little. Latin America's share of world trade fell throughout the postwar period, as a consequence of deliberate import substitution strategies reinforced by overvalued exchange rates. Comparisons with East Asia indicate that Latin America's high levels of debt were not necessary to fuel growth or to allow adjustment to the various shocks experienced by the world economy in the 1970s; at the least, a number of East Asian countries experienced unfavorable shocks as large as those facing Latin America, but recovered with lower levels of debt and faster growth.

Overall this study adopts a calm and measured tone, though banks may feel they come out somewhat the worse in the suggested apportioning of the costs. The discussion of adjustment measures may be the most valuable for North American readers, who may not be as accustomed to some of the arguments. Neither

the approach nor the conclusions of this study are particularly novel, however, which may reduce its value to experts in this field.

RICHARD P. MATTIONE

*Morgan Guaranty Trust Company of New York*

*The global factory: Foreign assembly in international trade.* By JOSEPH GRUNWALD AND KENNETH FLAMM. Washington, DC: Brookings Institution, 1985. Pp. xvi, 259. \$29.95, cloth; \$10.95, paper. ISBN 0-8157-3304-6.

JEL 85-0805

The assembly, in low wage developing countries, of components manufactured in the industrialized countries is the subject of this Brookings Institution study. The authors examine three basic issues. First, what is the nature and importance of this type of overseas production? Second, why has it arisen? Third, what are the costs and benefits to the home and host countries from such outward processing and how can the benefits to both countries be increased? The major portion of the book is devoted to four case studies that address these questions. The first and by far the lengthiest, by Kenneth Flamm, deals comprehensively with the worldwide semiconductor industry. The other three, by Joseph Grunwald and associates, are country case studies. They involve three Western hemisphere countries: Mexico, Haiti and Colombia. Surprisingly, although Southeast Asian countries such as Hong Kong, Korea, Taiwan and Singapore are mentioned as important assembly sites, none of these serves as a case study. This is a curious omission which limits the generality of some of the authors' findings.

Special tariff provisions such as 806.30 and 807.00 of the U.S. tariff code facilitate assembly abroad by permitting duty-free re-entry of U.S. components sent off-shore for assembly. Only the value added acquired abroad is subject to U.S. duty. In the developing countries the components are often assembled in export processing zones. The activities are concentrated mainly in two classes of manufactured products, electronics and apparel. As the authors point out, the value to weight ratios are high in both cases, so that transportation costs are low. Moreover, both can be manufactured in operations that can be easily separated in time and space. Since fashions and technologies change,

both products have relatively short life cycles. Subcontracting between independent firms is the chief vehicle used in the apparel industry, whereas in electronics the manufacturing is carried out largely by subsidiaries of multinational enterprises.

In each of the case studies, the focus is on the actions of U.S. multinationals as initiators of the assembly abroad, partly because the available data are American. Nevertheless, some interesting comparisons are made with Japanese and European firms. With respect to semiconductors, it is noted that through the mid-1970s assembly abroad was much more important to the U.S. firms than the others, but that Japanese overseas production was rapidly growing. This trend has clearly continued: the Japanese firm Fujitsu, for example, has recently announced its intention to acquire one of the largest U.S. producers, Fairchild, which was itself the first American producer to set up a manufacturing affiliate abroad (Hong Kong) in 1961. The greater presence of the Japanese in the U.S. market and the recent semiconductor trade agreement between the U.S. and Japan may have a strong impact on the way semiconductor production is divided globally.

As for the effect of assembly abroad on the developing countries, the authors conclude that the economic and social benefits are mixed. At the top of the list are increased exports, a better balance of payments, and increased employment for people who had not previously been employed. The argument that unemployment is reduced as participation grows. In terms of income, the study finds that during U.S. recessions, American plants at home are often closed as demand falls and output is shifted to lower cost assembly operations in the developing countries in order for the firms to remain competitive. This is the opposite of what is often alleged.

The area in which benefits are weak and could be enhanced is greater integration of assembly activities into the rest of the domestic economy. Increasing forward linkages, the authors postulate, could be achieved by allowing assembled goods to be used as inputs in the developing countries instead of restricting them to exports. The difficulty for the developing countries lies

on the ownership of forwardly linked activities. U.S. subsidiaries, not domestic firms, might be the chief beneficiaries, and this would often be unacceptable to the host countries. A *quid pro quo* advocated by Grunwald and Flamm is that U.S. firms should be induced to accept an agreed minimum on the value added or national content of goods exported to the U.S. Current U.S. trade policy sees national content requirements as protectionist devices. However, the idea is worth considering. To make the national content requirements more palatable to U.S. labor, the authors advocate shifting American workers to more skilled jobs through investment in education and training. This is good advice whatever is decided about national content rules.

A feature of the semiconductor chapter is the construction and estimation of a simple model to measure the social cost of "bringing home" semiconductor assembly to the U.S. The independent variables are the cost advantage of assembly abroad and the elasticity of demand for semiconductor devices. Flamm estimates that the cost would be in the order of six to twelve percent of the value of U.S. consumption of semiconductors depending upon the chosen values of the independent variables. This finding, however, must be considered at best as only suggestive since it requires such restrictive assumptions as a level of protection that completely excludes foreign imports from the U.S. market.

In the concluding chapter a provocative question is raised about how breakthroughs in automation may affect assembly operations abroad by redirecting production to the U.S. Unfortunately, Flamm and Grunwald do not then devote much attention to the ways in which automation can be carried out and their consequences. Some discussion of the viability of computer-aided manufacturing, computer-aided design, flexible manufacturing and computer integrated manufacturing would have enhanced this portion of the text.

The reader who is looking for a good analysis of assembling abroad and its impact on home and host countries would be well served by this book, which makes a useful addition to the literature. However, the enticing title, *The Global Factory*, invites greater expectations which are not met. Assembling abroad is just

one strategy used by multinational enterprises to lower the cost of their manufactured products. Multinational enterprises are increasingly acquiring imported inputs for assembly at home and are interchanging final products among factories scattered around the world. They also do a considerable amount of contracting out, even to the point where they buy final products from competitors and stencil on their own brand name. Much of this exchange is not the North-South trade which is discussed in this book, but trade among the industrialized countries. Complete discussion of what the authors term the international reorganization of product flows requires more than an examination of assembly abroad. If this task is too much for one volume, then the authors could have at least placed assembling abroad in the context of the overall trend toward the globalization of production.

*The process of investment in the Soviet Union.*

By DAVID A. DYKER. Soviet and East European Studies. Cambridge, New York and Sydney: Cambridge University Press, 1983. Pp. vii, 254. \$24.95. ISBN 0-521-24831-0.

JEL 85-0509

In terms of its breadth of coverage of various aspects of Soviet investment activity, depth of analysis and conceptual clarity David Dyker's monograph stands out among Western and Soviet works on the subject published in the last twenty years. (The best Soviet work on the subject—Victor Krasovskiy's *Problemy Ekonomiki Kapital'nykh Vlozheniy* [*Problems of Economics of Capital Investment*—was published in Moscow in 1965.) Dyker's book has become even more important now, when modernization of investment policy and restructuring of investment in the national economy occupies the central place in Gorbachev's economic program.

Beginning in the mid-70s and continuing into the mid-80s the Soviet economy experienced an unprecedented decline in investment activ-

ity. The official Soviet statistics reflect a slowdown in the rates of growth of investment. But some respected Soviet economists have claimed that if investment figures are adjusted for inflation they will reflect a reduction in absolute terms. However, the problem is not limited to an investment slowdown. The entire mechanism for investment planning and management is in disarray and the productivity of investment has been falling for more than a quarter of a century.

Beginning with the first five-year plan, none of the measures adopted by Stalin, Khrushchev and Brezhnev have succeeded in coordinating available financial and material investment resources with the scale of investment activity. For more than 60 years Soviet planners have tried unsuccessfully to create a mechanism that would enable the central authorities to control the investment process from Moscow. Numerous attempts to regulate various stages of the investment process were made. All of them were stillborn. The practice of investment planning and the reality of economic life in the Soviet system has developed entirely on its own—not subject to any regulations. Will the new Soviet leadership be able to reinvigorate the investment process without radical economic reforms?

David Dyker's study is of great value to those who are trying to answer this question. It can help Western specialists understand the essential features of the Soviet investment process. And, having worked for many years in investment planning in the USSR, I can say that this book has helped me understand and rethink a number of aspects of Soviet investment practice.

Dyker's study is very well structured; his presentation is logical and contributes to the reader's understanding of a difficult subject. He has devoted a large portion of the book to the development of a framework for analyzing the investment process in the Soviet economy. He has considered major aspects of the economic system which shape this process. Decision making in investment planning, design and construction are well covered. The choice of case studies representing five major investment programs in Siberia, Central Asia and Kazakhstan could not be more successful.

The study is distinguished by a profound un-

derstanding of the contradictions of the current investment situation in the Soviet economy. The discussion of the "reconstruction syndrome" provides a convincing explanation for the failure of the Soviet leadership's attempts to shift resources from construction of new industrial capacities to modernization of existing stock. According to Dyker, neither enterprise management, nor planning and design organizations, nor the construction industry have any interest in this type of investment activity.

The author does not overlook the perennial contradiction of the Soviet economy—the conflict between regional interests ("localism") and centrally-managed industries ("departmentalism") when it comes to allocation of investment. The decision to sharply shift investment from new construction to modernization of the existing stock adopted at the XXVII Party Congress will inevitably hinder the solution of one of the most important tasks of industrial development and the Soviet economy as a whole—the spatial deconcentration of production and the creation of priority conditions for the development of the eastern regions of the country.

I cannot agree with all the views expressed in David Dyker's book. For example, I was surprised to find out that enormous investment in agriculture cannot pay off for reasons of geography and harsh climate. It has always been my understanding that the reason for Soviet agriculture's poor performance

found in poor weather conditions, not centralized-command economy, collectivization conditions, or the annihilation of the kulaks. Even Soviet weather is not the problem. The Russian Plain, Western Siberia and the steppes produced crops abundantly. Russia one of the major exporters of grain in the world. The climate has not changed in the last seventy years.

It should also be pointed out that Dyker has not given enough attention to the discussion of investment problems which Soviet economic journals have conducted actively in the last few years. In theory and practice, Soviet planning gives special attention to its investment policy. The problems of labor and natural resources, by contrast, have always been matters of secondary importance for Soviet decision makers.

And now, despite the worsening deficit in the labor force and mounting difficulties in the supply of raw materials, the earlier relationship to economic resources has changed but little.

The people involved in Soviet economic planning seek to extricate themselves from this situation by optimizing their investment policies. This issue has come to provoke serious disagreements among leading experts in the USSR. The key question is whether, under conditions of declining investments, one can avoid a further slowdown in economic growth.

There are two schools of thought on this issue. One of them essentially justifies the slower tempo in investment growth. The argument runs as follows: the USSR has created enormous fixed capital and productive capacities, and although the investment curve is falling, it still has significant reserves in the form of more efficient use of existing productive capacity.

The opposing school argues that the maximum utilization of existing productive capacities was reached in the mid-1970s. Evidence for that is found in the decline in the use of productive capacity in the later 1970s and early 1980s; one simply cannot squeeze any more juice from this lemon. Hence, unless the negative investment trend is overcome, there is no possibility of preventing a further decline in growth rates.

Thus, it seems justified to conclude that we are about to witness, for the first time since the 1920s, a confrontation among Soviet scholars over the fundamental economic issue—investment policy. In the 1986–90 five-year plan the new Soviet leadership has adopted the second school's point of view and significantly increased investment (mainly in heavy industry) at the expense of the consumer sector of the economy. What results it will bring remain to be seen.

However, these comments do not by any means change my opinion that David Dyker's book is a valuable contribution to the study of the Soviet economy and that his fundamental work will be of great help to scholars working in this field.

## 600 Industrial Organization; Technological Change; Industry Studies

### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

*Regulating the automobile.* By ROBERT W. CRANDALL ET AL. Studies in the Regulation of Economic Activity series. Washington, DC: Brookings Institution, 1986. Pp. xiii, 202. \$28.95, cloth; \$10.95, paper. ISBN 0-8157-1594-3. JEL 86-1172

What is good for General Motors is good for society was conventional wisdom some years ago. But questions arose about the environmental, safety and energy consequences of automobile travel at the same time that people perceived monopoly profits were being reaped. Mandatory standards for exhaust emissions, vehicle safety and fuel efficiency followed. Today we ask what these regulatory programs have accomplished and how well they have performed. Robert Crandall, Howard Gruenspecht, Theodore Keeler and Lester Lave, all associated with the Brookings Institution, offer some unsettling answers.

To begin, the authors describe the incredible transition in the U.S. automobile industry during the last twenty years. The market share of imports has tripled, car size decreased and the market for eight cylinder cars nearly disappeared. The "enormous upheaval in Detroit" (p. 12) is attributed to large increases in gasoline prices in 1974 and 1979 and to the lower prices and improving quality of imports. The auto industry, they point out, changed from a comfortable triopoly plus one to a manufacturing group protected by voluntary import quotas. Competitive pressure continues as foreign producers expand, e.g., a new Toyota plant here in Kentucky near Lexington.

"The Costs of Safety and Emission Regulation" are addressed in Chapter 3. One estimate is based on existing engineering data for equipment and additional maintenance and fuel costs. Adjustments for production learning and inflation are made. The largest cost increases occur in 1972–1974 for emissions control, bumpers and interlocks and in 1981 for closed-loop emission control and bumpers. The additional cost of owning and operating a 1981 car

is estimated to be approximately \$2,400 with one third of that due to safety regulations. A second estimate of \$1,300 per car is based on a translog function for operating costs. Econometric analysis of new car prices and industry profits shows that two thirds of the costs are passed on to consumers with a one year lag.

Chapter 4, "The Effects of Regulation on Automobile Safety," is the first of three chapters that analyze one specific regulatory program. The authors describe trends in the preregulatory period. Some readers will be surprised to learn that the fatal accident rate fell by fifty percent between 1921 and 1941 and fell steadily from 1947 to 1962. With an econometric model of traffic fatalities they separate the effects of regulation from nonregulatory effects. The safety variable, a direct measure of crashworthiness standards, is crucial. Passenger car occupants are found to be much safer and total fatalities lower because of regulation. Other travellers are found to face greater risks. The most vulnerable travellers appear to suffer. Based on my own work I find this evidence of risk compensation quite compatible with other evidence. The surprise is the "remarkable effects" (p. 64) on vehicle occupants compared to the presumably upper-bound estimates from engineering studies. This "puzzle" (p. 69) leads the authors to discuss nonregulatory alternatives and be cautious about passive restraints. They conclude the safety program has worked tolerably well to reduce total fatalities at a moderate cost. Use of known, not forced, technology is a reason.

Chapter 5 is "Automobile Emissions Control." The original technology forcing standards set by Congress required ninety percent reductions in emissions from pre-1968 levels by 1975. The authors acknowledge emissions for hydrocarbons and carbon monoxide were halved but show reductions are far short of goals. Substandard road performance and more driving in older cars explain the difference. Growth of inspection and maintenance programs may reduce the disparity, but the authors are not optimistic. They conclude the emissions program has reduced emissions substantially, but much less than mandated. Without large aesthetic benefits (which are not estimated) the program is not worth the costs, especially with the expensive 1981 standards.

"Regulation of Fuel Economy" is discussed in Chapter 6. The corporate average fuel economy (CAFE) standard required a fleet average of 27.5 mpg by 1985. Between 1974 and 1984 fuel economy increased by over fifty percent. Manufacturer response to gas price increases, however, leaves little room for any regulatory effect on fuel economy, at least through 1981. Regression analysis of car model fuel economy shows manufacturers, especially General Motors, made technological improvements which precede the CAFE standards. Actual improvement in design fuel economy is what the authors expect given the higher price of gas. Of the total improvement, half is due to design changes and half to reductions in engine displacement and vehicle weight. They conclude that the fuel economy standards have been irrelevant until recently.

In the final two chapters the authors describe the conflicts among the three regulatory programs and make an assessment. They conclude the programs have not been coordinated for maximum overall impact at lowest cost because they are administered separately and conflicting goals are ignored. The tradeoffs between emissions control and fuel economy and between expensive new car standards and greater use of older cars are clear. They conclude that without Congressional action regulatory goals are unachievable.

Essentially this is a study of the automobile industry. The authors conclude the market-based rate of innovation is the best for the emissions which improve the worst regulatory performance. Their analysis can be criticized for slighting nonpecuniary user costs, ignoring public and private costs of administering regulatory programs, and for keeping Durbin-Watson values a secret. It can be criticized for leaving unanswered questions about why apparent policy failures go uncorrected and why impacts on air quality, fatalities and fuel consumption go unmeasured. But Robert Crandall and his colleagues do not promise a perfect or a positive analysis. What they promise is thorough normative analysis of automobile regulation. They deliver.

## 630 INDUSTRY STUDIES

*The economics of nonprofit institutions: Studies in structure and policy.* Edited by SUSAN ROSE-ACKERMAN. Yale Studies on Nonprofit Organizations series. New York and Oxford: Oxford University Press, 1986. Pp. xvii, 423. \$39.95. ISBN 0-19-503709-X. JEL 86-1199

This volume is the first in a new series edited under the auspices of the Yale University Program on Nonprofit Organizations, an interdisciplinary research enterprise started in 1977. It contains a collection of studies which look at the nonprofit sector from an economic perspective. The first half of the volume, entitled: "Models of Nonprofit Firms," addresses general theoretical and conceptual issues. The second half, "Public Policy Toward Nonprofits," deals with the issue of how governments affect the behavior of nonprofit organizations through the tax system, through direct spending and through regulations. The issues discussed under this rubric include, in particular, the tax deductibility of charitable contributions, direct government grants to nonprofit organizations, regulation of fundraising practices, and corporate tax benefits for nonprofits.

As the editor points out, the volume aims at two audiences. It is intended to show to noneconomists, interested in the nonprofit sector, how economic arguments can contribute to our understanding of this sector. And it is intended to present to economists a new field of study that deals with a distinct category of organizations, "different from both for-profit firms and public agencies" (p. 3). With regard to the latter purpose, the essays included in the first, theoretical part should be of particular interest and the remainder of this review will focus on them.

The ten articles (and two comments) collected in the theory section are somewhat heterogeneous, not only in the analytical approaches they apply but also in the ways they define their subject and in the issues they address. There is, however, a dominant theme that is present more or less explicitly in the majority of the contributions, a theme that seems to be at the core of what in this volume is presented as a new field: "economics of nonprofits." It is the notion that nonprofit organizations, due to their basic legal characteristics which prohibit them

from distributing profits, can be more efficient in serving certain consumer wants than their for-profit counterparts. Their performance characteristics (rather than tax preferences or government subsidies) are considered to provide the essential explanation for why nonprofit firms exist and why they proliferate in certain areas of activities rather than in others. This notion is most comprehensively elaborated in H. B. Hansmann's article "The Role of Nonprofit Enterprise" (pp. 57-84), but it is, in variations, at the heart of several other contributions as well.

Given the crucial role that is assigned to what is called the "nondistribution constraint," surprisingly little can be found in this volume about just how this legal prohibition actually translates into the beneficial performance characteristics that nonprofits allegedly possess. The argument on which the efficiency of the nonprofit form of enterprise is based has two parts. It is, first, supposed that in certain situations where customers are in a poor position to judge or to monitor the quality of the service they want to purchase (due to information asymmetries or to separation between purchaser and beneficiary) market competition is less effective in protecting consumer interests. Second, it is supposed that under such circumstances consumer interests tend to be better served by nonprofit than by for-profit firms.

While the claim that nonprofit organizations have this desirable characteristic is repeated again and again, no rigorous analysis supporting this claim is actually carried out in any of the articles. The explanatory arguments that are presented oscillate between two different lines of reasoning: The one arguing in terms of *differences in constraints* faced by managers of nonprofit and for-profit firms, the other arguing in terms of *differences in managerial motivation*. Neither of the two is, however, systematically elaborated into a coherent explanation. As for the first, one looks in vain for a careful comparative analysis of the actual choices faced by managers in both types of organizations. And, incidentally, one may well doubt whether such an analysis, if carried out, would actually support the claim that the "nondistribution constraint" systematically induces a more consumer-oriented behavior. In fact, the authors invoking this notion seem to have their own

doubts and admit that this is not necessarily true in all cases—without taking the trouble, however, of specifying the conditions under which this can be expected to be true or not. The second line of reasoning that assumes differences in managerial motivation remains even more ad hoc than the first. Apart from methodological issues that could be raised in this context, one would certainly want to learn more about the actual mechanisms that can be expected to systematically bring the more publicly and altruistically spirited persons into the nonprofit sector and the more selfish ones into for-profit organizations. The “self-selection” mechanism cited by some authors remains too vague to provide an answer.

Nonprofit organizations are certainly an interesting subject for economic analysis, and the volume compiled by Susan Rose-Ackerman deserves credit for bringing more attention to this somewhat neglected part of the economic universe. Whether a fruitful and coherent approach to an “economic theory of nonprofit organizations” may indeed be developed along the lines suggested remains to be shown.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

*The transformation of Mexican agriculture: International structure and the politics of rural change.* By STEVEN E. SANDERSON. Princeton, NJ: Princeton University Press, 1986. Pp. xxii, 324. \$42.00, cloth, \$10.95, paper. ISBN 0-691-07693-6. JEL 86-0888

This book is an evaluation of agricultural development in Mexico in terms of three goals that the author has in mind: increased incomes for the rural poor; improved nutrition for the rural poor; and survival of the peasantry. Of central interest to the author is the role of state control of agriculture in “steering” agricultural development toward these objectives.

There are three main sections of the book. The first chapter gives an overview of the agricultural sector in Mexico and the “new international division of labor.” (The latter, we are told, refers to the employment of the labor force “for the sake of industrial and agricultural ra-

tionalization at a global level,” as well as to the migration of people from their homes to foreign sites of employment). The second major section consists of three chapters devoted to developments in fruits and vegetables, in beef production, and in the basic grains. This middle section contains some useful tables of time-series data on these commodities, although the author has not attempted to reconcile some internal inconsistencies in the data. The final section consists of a chapter devoted primarily to a description and analysis of the institutions for state intervention in agriculture.

The author's conclusions include the following. Mexican agriculture has not served the three goals well, and in fact is in a state of crisis. The cause of the crisis is the orientation of agricultural production to export crops and products for up-scale domestic consumers (wheat and asparagus, for example), rather than basic subsistence crops. The Mexican government has little or no capacity, in the face of the internationalization of agriculture, to “steer” agriculture toward its proper goals.

Most economists will find the analysis unpersuasive. Very little if any data is presented to establish the crisis with respect to the three goals. There are no time series on the number of peasants nor on their income. There are only brief data on the 1980 census. It is taken for granted that peasants are flocking to the cities. The conclusion of this would be especially since the data included suggest that the assumption of many commentators that the number of peasants is increasing over the past two decades.

The author's conclusions seem to be primarily based on his assumption that the production of commercial crops must leave producers and their families with less ability to acquire basic foodstuffs than if they had directly produced those basic foodstuffs themselves. Given this conviction, one only has to observe the commercialization of production in order to establish a deterioration in nutrition and presumably in real income. In essence, this is the line of reasoning pursued by the author.

Given the conclusion that agriculture is in crisis, it follows that state control has not been very effective in realizing the goals described.

The author argues that the instruments available in recent years, namely input and output price subsidies, subsidized insurance and subsidized credit, are not effective in allowing the state to steer agricultural development toward the goals. He asserts that these instruments are especially ineffective in an internationalized agriculture. He does not make very clear why all this is so, and does not directly state what instruments he thinks would be more effective, though he hints that land reform would be a better route.

The author is clearly convinced that state control is necessary to achieve the stated goals, but his prescription for improved state steerage will not be very helpful. He concludes that the state must husband its resources more carefully (stop wasting resources on the export of white asparagus) and must target the recipients of its benefits more carefully. Unfortunately, the mechanisms by which this might be accomplished more successfully than in the past are not specified.

## 800 MANPOWER; LABOR; POPULATION

### 810 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

*Understanding human resources: Perspectives, people, and policy.* By ELI GINZBERG. Lanham, MD: University Press of America, Inc., 1985. Pp. xvii, 744. ISBN 0-8191-4869-5.

This book is a collection of some of the papers Eli Ginzberg has written on human resource issues and policies during the period 1934 to 1984. Over these five decades Ginzberg was witness to important changes in manpower utilization: the Depression, the Second World War, recovery and growth, the rise of large organizations, the Civil Rights revolution, the changing role of women. All these and more are examined and so too their human resource implications.

Thus the volume, imposing in its scope, can be read as a (social) history of America set in the framework of the relationship between its people and the world of work. It can also be read as a history of private and public human resource (manpower and womanpower) policy

set within the framework of economic analysis. And, of course, it can be read as a chronicle of the perspectives and observations of one of the nation's leading social scientists on one of the continuing economic and social issues that we face and that any evolving society will continue to face. The reader will be rewarded whatever prism he or she selects, be it history, economics, political science or even, since the pieces are so readable and the turn of phrases so apt, as literature. There is much wisdom contained therein.

I began the over 700 pages with a plan: to dip into this and that essay, to find a few that especially intrigued me that I thought might interest others, to focus on a very limited number of concepts and ideas that were particularly interesting, and, finally, to provide the reader with some brief overall evaluation of whether and why the volume might be of interest. This plan went awry. I began my reading with page ix and since I found each section and each essay within it both interesting and useful, I read the entire volume. I believe that others will also do so, even those already familiar with many of the essays. There is much to be gained from seeing them together and, thus, following the themes and threads.

The book has ten sections: Ideas and Reality; Career Choice and Performance Potential; The Unsuccessful; Women; Older Persons; Blacks; Technology and the Changing Economy; Human Resources Management in Large Organizations; Metropolitanism: Focus on New York; Programs and Policy. In addition there is a final "Afterword: Cleanings and Challenges" in which Ginzberg sets forth eleven propositions about human resources and five areas in which "new and improved knowledge about human resources is needed."

The general perspective of the volume, with which this reviewer is in agreement, is revealed in the first essay, "What Kind of Man was Adam Smith":

At the beginning of its third century, the discipline of economics faces a simple alternative. It can continue to postulate that the market alone controls the behavior of men, or it can go back to the roots Smith planted and become the discipline of political economy. (p. 11)

This theme is amplified and discussed more fully and with linkage to human resource policy

in "Values in Social Theory." The beginning student (and the senior scholar) will find that essay critical to his or her understanding of the volume—and of Ginzberg's approach both to economic research and policy formulation. Here Ginzberg sets forth the need to examine the economic, political, and social dimensions of the issues that he subsequently addresses. In essence he rejects the old adage that states "You can make even a parrot into a learned political economist—all he must learn are the two words 'supply' and 'demand'." Political economists must know much more. The subsequent essays support this point. Many of them are conceptual pieces in which Ginzberg sets forth the way we might think about a specific problem. In doing so he forces us to consider a host of variables.

One of the most interesting sections is "Career Choice and Performance Potential." There we see the interplay between theory and field work and the interplay illuminates the issue of occupational choice. It does so by questioning long held assumptions by guidance counselors and by "viewing the choice of an occupation as a chain of decisions," i.e., as a process. It, therefore, follows that the subject of inquiry must be that process and the sequential decisions within it. This developmental theory (and its subsequent modifications) is outlined in essays 7 and 8: "A Developmental Model of Occupational Choice" and "Ginzberg's Theory: A Retrospective View." The final section of the latter essay discusses the practical applications of Ginzberg's theoretical formulation. These should be of interest to labor economists and practitioners in the field of personnel and human resource development, and to any who are concerned with the maximization of employment opportunity and of human potential in an economy as diverse and heterogeneous as ours. The power of Ginzberg's approach and of his developmental model is best illustrated if the two essays are read together with essays 13 and 14: "Soldiers Who Failed" and "Patterns of Performance," a juxtaposition enabling the reader to see how general theory can be applied to a particular human resource issue.

There are other essays that bear discussion. Nevertheless, it seems to me more useful to focus on a few methodological points that reveal Ginzberg's perspective and that lie at the heart

of his contributions. The first is the emphasis on the influence of process on outcomes. It is no accident that Ginzberg examines patterns of organization, that he refers to American democracy, that he discusses styles of leadership. He is interested in statistical relationships but even more in causality and, therefore, in examining the process that leads from "a" to "b." Second, the evolutionary view: his analysis and policy recommendations are sensitive to change and he views change as evolutionary. While Ginzberg classifies many of his recommendations as "modest," that term is hardly appropriate given his time horizon. Third, the inherent optimism: situations can be improved and will improve, but only if we intervene to improve them. To do so effectively requires an understanding of the economic forces at work and an appreciation of American society. As noted, Ginzberg's essays call upon us to think. The power of the essays is enhanced because he also feels and cares about the society in which he lives.

There may be some who, noting the absence of mathematical formulations and statistical manipulations, will consider the essays as "perhaps interesting but really second-hand economics." While it is true that the essays can be read as such, they could not be if the questions asked and the grounding in analysis and theory and can be learned is not sufficient. Also, to read them in isolation is to miss the point. The reader who reads this volume will discover that it is that quality that Eli Ginzberg has in fullest measure.

Harvard Medical School

#### 820 LABOR MARKETS; PUBLIC POLICY

*The process of occupational sex-typing. The feminization of clerical labor in Great Britain.* By SAMUEL COHN. Women in the Political Economy series. Philadelphia: Temple University Press, 1985. Pp. viii, 279. \$34.96. ISBN 0-87722-402-1. JEL 86-0909

Occupational segregation by gender is a salient characteristic of all industrialized societies.

Certain occupations are overwhelmingly female while others are almost entirely male, producing what Samuel Cohn terms "a virtual bifurcation of the labor market into male/female sectors" (p. 4). Why does this gender-typing of occupations occur? And how does it take place?

Cohn seeks to shed light on these questions by studying the increasing employment of women in clerical work during the nineteenth and early twentieth century in two large British organizations: the General Post Office (GPO) and the Great Western Railway (GWR). The GPO was one of the earliest employers to use women as clerical workers; the GWR was one of the last. By examining the reasons for the different employment strategies, Cohn arrives at several interesting insights into the phenomenon of occupational segregation. He also demonstrates the utility of combining qualitative and quantitative analyses in labor market case studies.

The first chapter provides a framework for thinking about occupational segregation, explains the study's research design and relates the history of the GPO and the GRW. Chapters 2-8 examine, in turn, seven possible explanations for why women entered clerical work, and why they entered the GPO, the GRW, and the various semiautonomous departments of these companies at differential rates. Each of these chapters' conclusions summarizes the main empirical findings connected with each of the explanations. In the final chapter Cohn elaborates his theoretical insights and discusses their relevance for occupational segregation at the national level.

Cohn's major point is that patterns of occupational gender-typing result not from the characteristics or preferences or "socialization" of women, but rather from the characteristics of firms. In the absence of equal pay laws, women can be hired at a lower wage rate than men in virtually any occupation. Cohn argues that two conditions will increase the likelihood that employers will take advantage of lower-priced female labor. Women will be hired instead of men whenever the firm is not "buffered from labor costs" that is, whenever the firm is labor intensive and under pressure to maximize profits.

Women also will be hired whenever the firm has both tenure-based salary scales and learning

curves that are low and peak relatively early. Under such conditions, unless the firm is growing rapidly and providing continual opportunities for promotion, the employer will wish to stimulate turnover of those workers whose wages would otherwise outstrip their productivity. In the absence of adequate natural turnover, a marriage bar, where any woman who got married had to quit immediately, was an "ideal" producer of "synthetic" turnover. Marriage bars were practical tenure bars, Cohn argues, because they were acceptable and easy to legitimate, conforming as they did to traditional gender-role ideology that viewed work and family as incompatible. In Cohn's words:

Hiring sixteen-year-old women and forcing them to retire at marriage ensures careers anywhere from six to ten years long. This is long enough to ensure the conservation of any firm-specific skills, but not so long as to create a severe crisis of productivity. (p. 225)

Two of the usual explanations of why women increased their representation in clerical work are not borne out in Cohn's analyses. First, it seems unlikely that the increased employment of women was supply-driven. Cohn finds that as early as 1870, there seemed to be an "unlimited" supply of women willing to do clerical work. Second, it does not appear that employers sought women to do clerical work because the job was deskilled.

Women entered clerical work not because there was an increase in the proportion of unskilled jobs, but because managers changed their strategies for filling these unskilled jobs. (p. 223)

Cohn's book adds a good deal to our understanding of occupational segregation. It treats controversial complexities with scholarly sophistication and employs quantitative work that is careful and innovative (although one could ask for more clarity in the tabular presentations). There are several arguments for which I wish he had provided more data (for example, although real clerical wages did not decline from 1909 to 1929, how did they do relative to other wages?), but my major criticism of the book is that key concepts are not well-explicated.

Cohn uses the terms patriarchy, feminization, discrimination and sexism throughout the book, but he does not clearly define them.

What is patriarchy? How does it differ from discrimination and sexism? Does discrimination include occupational exclusion as well as unequal pay for equal productivity? How does the concept of buffering from labor costs differ from Gary Becker's concept of taste for discrimination? Is synthetic turnover a manifestation of discrimination? Is feminization a process or an outcome or both? If an occupation or a job is feminized, does that mean that the proportion of women in the occupation has increased or does it mean that more than half of the incumbents are now women?

Cohn is not alone in being unclear about these definitions. Those doing work on labor markets need to bring more precision to the use of these concepts.

MYRA H. STROBER

*Stanford University*

*The black youth employment crisis.* Edited by RICHARD B. FREEMAN AND HARRY J. HOLZER. National Bureau of Economic Research Project Report series. Chicago and London: University of Chicago Press, 1986. Pp. ix, 469. \$55.00. ISBN 0-226-26164-6.

JEL 87-0284

The major social and economic problem explored in these eleven papers prepared for the National Bureau of Economic Research can be illustrated by a few figures from the summary chapter by the editors. The percentage of the 18 to 19 year old male white population employed in 1954 was 61.3; in 1981 it was 61.4. The corresponding figures for nonwhites are 66.5 and 34.5. While the white employment to population ratio for this age group remained stable over 27 years, the nonwhite ratio fell by almost half. These papers cast strong new light on this puzzle, which nevertheless remains a puzzle.

At a time when most empirical research in economics consists of the skillful manipulation of data provided by government agencies, an outstanding feature of this volume is that most of the papers are based in whole or in part on data collected especially for this project. The principal such data set is the NBER survey of black youth, which resulted in 2,854 completed interviews with black males aged 16 to 24 in inner city areas of Boston, Chicago and Philadelphia. This survey provides data on many var-

iables, such as church attendance, drug use, self-reported illegal activities, time use, and absenteeism that are not available in standard statistical sources. These data permit the papers to explore relationships between economic, sociological and psychological factors in a way that is all too rare in social science literature. Needless to say, these explanatory effects are not uniformly successful, but some strong patterns emerge. For example, church attendance is strongly correlated with high employment rates and low rates of illegal activities and drug use (Table 9.4), although it is hard to tell whether these are causal relationships, or the joint product of other factors.

A second new data set is the basis of the paper by Jerome Culp and Bruce H. Dunson, who use matched pairs of black and white job-seekers in Essex County, New Jersey in an attempt to measure racial discrimination by employers. Here a promising research design gives results that are at best suggestive because of woefully inadequate sample size.

Perhaps the most interesting paper in the volume is David Ellwood's "The Spatial Mismatch Hypothesis." Since the work of Kain (1968) it has been widely believed that a major cause of black unemployment has been the movement of jobs where blacks reside. In the Chicago metropolitan area, for example, black youth who live on the outskirts are as likely to be unemployed as those who live in the inner city, and that the difficulty of finding jobs for blacks in the inner city of black and white youth in small neighborhoods is not alleviated in the metropolitan area as a whole.

Other new insights are provided by Harry J. Holzer's paper "Black Youth Nonemployment: Duration and Job Search." Holzer reports that the duration of spells of nonemployment are substantially longer for black youth than for white, and relates this finding to reservation wages (the lowest wages at which youths would be willing to accept various kinds of work). Although the reservation wages of blacks are slightly below those of whites according to 1979 data from the youth cohort of the National Longitudinal Surveys, the reservation wages of blacks are consistently higher relative to the wages they actually received on their most recent jobs. This suggests that overoptimistic ex-

pectations are a factor in prolonging the duration of back nonemployment.

The paper by W. Kip Viscusi "Market Incentives for Criminal Behavior" is a brave attempt to exploit an inadequate data base. It is surprising that the NBER data set collects as much self-reported information as it does about illegal activity. However, the illegal activities reported are mainly the less serious ones such as illegal gambling and drug dealing. The fraction of the sample who admit to burglary, robbery or mugging is one percent or less. Viscusi's model has youth choosing between crime and employment on the basis of the expected returns. In a perceptive comment on this paper, James W. Thompson and James Cataldo point out that much of the admitted crime in the survey was committed by employed youths, and that Viscusi's modeling of the incentives may be flawed.

Taken as a whole, this study represents an ambitious and generally successful effort to investigate a highly complicated social problem. The result is a major addition to what we know, even though there is a great deal that we still do not know and would like to learn. The authors have engaged in a vigorous and imaginative exploration of the data, and we have been well rewarded by it.

Such thorough exploration of data is part of an old National Bureau tradition, ridiculed by Koopmans (1947) as "measurement without theory." But perhaps the pendulum has now swung too far the other way. Not every paper in economics needs to start with deductions from first principles. As Freeman, Holzer, and their colleagues have shown us, there is still much to be gained from a more inductive approach.

The motivation for this book lies in what Martin Godfrey characterizes as changes in the world economy that have rendered past theoretical analyses of unemployment inadequate either for understanding its causes or for formulating policies for its alleviation. Theorizing in industrialized countries had typically been cast in short-run or cyclical terms while that for less developed countries has had a long-run developmental focus. However, the emergence of stubbornly high unemployment levels in the industrial countries beginning in the early 1970s is held to require a reorientation of theory along the lines usually applied to developing countries. Furthermore, the growing tendency to locate industrial production for the world market in less developed countries (LDCs) and the extensive use by industrial country employers of migrant LDC labor imply that unemployment can no longer be analyzed solely within a national context. In essence, recent trends suggest an increasing internationalization of labor markets and, therefore, require a revised or global approach to theorizing about employment.

The author has chosen to review two centuries of theory on the nature, causes, and consequences of unemployment or, more generally, of underutilization of labor in both developed and developing economies. Out of this review he seeks to identify ideas that may prove useful for contemporary theory on the causes of unemployment and for formulating policy initiatives to reduce it.

The historical review is spread over seven chapters that make up the bulk of this volume. Each of these is devoted to a particular "school" or approach to the determinants of employment or unemployment. These include the classical theories of surplus population, neoclassical and Keynesian theories applicable to mature capitalist economies, and four approaches focusing

on surplus labor in developing countries—those of neoclassicists, developmental economists, "Keynesians," and Marxists and neo-Marxists. A concluding chapter evaluates recent trends that may be indicative of a convergence of the approaches applied to mature and developing economies and identifies the directions Godfrey considers to be most fruitful for further contemporary theorizing.

Most of the classical theories of surplus population are considered as offering no insights into contemporary issues. Only Marx is cited as relevant. Whereas Ricardo and Malthus viewed labor markets as tending towards equilibrium by variations in population growth rates, Marx posited the existence of labor surplus as a permanent feature of a capitalist economy. The contemporary parallel is the prolonged survival of high unemployment rates in the industrialized economies with no corrective mechanism operating to restore full employment. The neoclassicists' concern with comparative statics and efficiency are irrelevant for today's problem. The current concern is not with achieving fuller employment by moving down along demand schedules but rather with shifting them to the right. In addition to Keynes, Godfrey reviews the contributions of Kalecki, Harrod, Domar, and the various writers on the Phillips Curve and its augmentations. From the "disarray" characterizing these approaches, Godfrey identifies two as currently relevant: the Keynesian notion of aggregate demand deficiency as a cause of unemployment; and the notion of a "natural rate" of unemployment, that level at which inflationary expectations are consistent with experience so that the rate of inflation remains constant. While these theoretical insights are held to be useful, they do not lead to clearly defined policies for achieving the twin objectives of low unemployment and price stability.

Neoclassical theory is no more relevant for developing countries than it is for mature economies. While its emphasis on distortions of various prices on the demand side and on the factors governing individual choice on the supply side may be useful for explaining some phenomena at a moment in time, it is much less useful for explaining changes in the degree of labor utilization over time. More promising in Godfrey's eyes are the developmentalist "Keynesians," so called because of their emphasis on

the demand side and on the inadequacy of investment. The theoretical remedies range from the balanced growth models of Rosenstein-Rodan to Currie's leading-sector and Knapp's vent-management approaches, the latter involving government price and market guarantees to producers of a wide range of products as a means of stimulating new investment. Godfrey recognizes that the success of these approaches requires that certain stringent conditions be met that may, in fact, lie beyond the ability of LDCs to satisfy. Nevertheless he suggests that the process of formulating new useful approaches to the analysis of unemployment could do worse than to begin with a review of this body of literature.

While the introduction and definition of the employment problem may create an expectation that a new broader frame of reference for the analysis and amelioration of unemployment is in the offing, most readers are not likely to consider this expectation satisfied. By and large, unemployment is still treated as a national problem to be addressed at the national level. The "internationalization of labor markets" is relevant only insofar as capital movements, imports, or migrant labor threaten domestic employment opportunities. But even here, some limits may have been reached. The end of the import-replacement era in Europe and the move of the oil producing countries to increasingly Fokker-Fokker capital and commodity markets to move with relative ease, the relocation of production is unlikely to reduce labor underutilization in the developing countries (p. 228).

The greatest virtue of this volume lies in its concise reviews of the principal schools of employment theory. While Godfrey dismisses most past theory as irrelevant for purposes of developing employment-promoting policies, he ultimately fails to break new ground. Few economists are likely to disagree that significant and permanent improvements in employment conditions require sustained capital accumulation and growth. Beyond this, most of the "new" insights that are offered for consideration by contemporary theorists strike this reviewer as simply old ideas in new dress. Furthermore,

the author's relegation of most of the adult population of the developing world to an "international reserve army" leads him to dismiss supply side theory as irrelevant. His assumption that the supply of labor to modern economic sectors is perfectly elastic is likely to be questioned by students of at least some LDC labor markets. Godfrey holds that an increase in economic efficiency is achievable only by promoting a faster rate of investment and growth. He therefore regards the neoclassicist's concern with efficient resource allocation as irrelevant to the current problems of stagnating economies. Instead, he is led to advocate protectionism and import substitution measures to provide powerful incentives to investment and thus to rekindle growth in the advanced but "deindustrializing countries." While he acknowledges that such policies have generally spawned inefficient growth he appears confident that safeguards can be adopted to forestall such an outcome. Many economists are not likely to share his optimism.

PETER GREGORY

*University of New Mexico*

*Pensions, economics and public policy.* By RICHARD A. IPPOLITO. Homewood, IL: Dow Jones-Irwin for the University of Pennsylvania, Wharton School, Pension Research Council, 1986. Pp. xxiii, 267. \$25.00. ISBN 0-87094-760-5. JEL 86-0913

Labor economists are interested in the work incentives created by pension plans, while financial economists are concerned with their role as a vehicle for tax-sheltered saving. Both perspectives are nicely balanced in this volume, which draws together the research findings of the author during his years as director of policy and research for pensions at the U.S. Department of Labor. Throughout, Ippolito exhibits a healthy respect for market outcomes, as benefits an economist trained at the University of Chicago. He makes extensive use of a comprehensive data set created at the Department of Labor. Detailed summary statistics and regression results support the analysis conducted throughout the volume.

The book is divided into five parts: (1) the economic principles of pensions; (2) pension growth; (3) economic implications of pensions; (4) pension plan characteristics; and (5) public policy considerations. The key chapter in the

first part develops the author's implicit contract model of pensions. In essence, Ippolito argues that workers "pay" for real pension benefits, in spite of the fact that the benefits legally due under the plan are nominal. Workers forego cash wages in return for pensions that are tied to their final wage just prior to retirement, rather than their current wage. The key implication is that the wind-up or termination measure of the firm's pension liabilities, which is based on the firm's legal obligations, understates the true or "economic" pension liabilities of the on-going firm. As Ippolito shows in a follow-up chapter, a firm's legal pension liabilities may typically be as little as 50 per cent of its "economic" liabilities. Based on the latter concept, pension plans in the aggregate are not overfunded, and plans in the union sector are decidedly *underfunded*.

The second part provides evidence on the actual and projected rate of growth of private pension plan assets, including the growth of defined contribution plans. The third part assesses the impact of pensions on the labor market, including retirement age, and the capital market. The key chapter in the fourth part addresses the underfunding puzzle. Ippolito hypothesizes that firms are willing to forego the tax advantages of full funding in order to make unionized workers long-term bondholders of the firm, and thus to limit workers' ability to raise wages or to reduce productivity and thus to threaten the long-term viability of the firm.

The fifth part contains two chapters on public policy toward private pension plans. In the first, Ippolito starts from the assumption that the goal of public policy is to eliminate obstacles that might impede market solutions to the problem of generating retirement incomes. His recommendations include, for example, the elimination of all constraints on private pension plan rules and the "privatization" of federal pension insurance. While many readers may be unpersuaded by these recommendations, all should benefit from the discussion of the economic reasoning behind them. In the second chapter, Ippolito's analysis focuses on the most controversial issue in the pension field today, the termination of overfunded plans with the reversion of surplus assets to the employer. In his excellent discussion, the author explains how the implicit contract model suggests that some

workers may suffer economic losses from such terminations, but reminds us that our understanding of the rationale for such terminations is sufficiently incomplete to warrant caution in formulating policy. He recommends that the government *not* attempt to redefine asset ownership, but rather take steps to facilitate *explicit* pension contracting, as well as to devise a means to recoup the tax gains embedded in reversions.

The policy recommendations in this book, as well as some of the economic arguments, will be controversial. Economists might question, for example, whether the implicit contract model applies with equal force to the union and nonunion sectors, in light of the explicit contracting that occurs in the former. Ippolito's explanation of the underfunding puzzle may also provoke debate. Since the underfunding of union plans is due to their periodic and retroactive enrichment, some may argue that this underfunding is simply a by-product of unions' desire to redistribute wealth to older workers.

Although the author's implicit contract model and major related findings are already available to economists (for example, Ippolito 1985a, b), I am pleased to recommend the book to those who would like more convenient access to these important contributions. I would also recommend the book to those, economists and non-economists alike, who seek a fuller understanding of the economic issues that are pertinent to the pension policy debate.

*Working lives. The American work force since 1920.* By JOHN D. OWEN. Lexington, MA and Toronto: Heath, Lexington Books, 1986. Pp. 218. \$25.00. ISBN 0-669-11265-8.

JEL 86-0918

In a refreshing change from the best of current labor economics, John D. Owen attempts

to view broadly the evolution of the U.S. labor market over a long period, the interval between 1920 and 1977. He focuses on the large demographic trends that have so substantially altered the composition of the U.S. work force, namely the withdrawal of the young, the entry of adult females, and the acceleration of retirement among older males.

Owen considers a variety of special topics: pension effects on retirement, schooling effects on the labor supply of the young and on their fathers (who must help support the young in their venture), wage effects on female labor supply, and the occupational demand shifts that supported the wage changes. The strength of his presentation is in his appeal to a variety of commonsensical confirmations and contradictions of common hypotheses.

Owen does present an original statistical analysis, but this effort is not persuasive. Owen's sample is U.S. aggregates of five age groups at ten dates between 1920 and 1977. Even were the data accurate, the limited sample would not permit him to test hypotheses of much subtlety. In fact for a substantial part of the period the data is crude or nonexistent. The census labor supply concept before 1940 (gainfully occupied) was radically different from later measures. The census did not collect earnings data before 1940. Unfortunately the life cycle model is not sufficiently developed to show how Owen collects data for the earlier years although his estimation proceeds.

Perhaps of the greatest criticism of the economists is Owen's selection of data. How successful is his selection in predicting actual life cycle behavior? Although the data are clearly useful, they do not seem to permit him to break free of the synthetic cohort approach of traditional life cycle analyses; he has wage and labor force data of some sort over a whole work life of one cohort and the larger part of several others. Owen finds little support for the deterministic life cycle model that he identifies with Ghez and Becker. In the U.S. in the period 1920 to 1977 the real wages of men rose fourfold. More importantly for the life cycle hypothesis, the real wages of males who were teenagers in 1920 rose 7.5 times by the 1970s. The incentives to withhold labor as teenagers and to work as golden-agers would

seem to have been immense for the members of this cohort yet they insisted on working early and retiring early.

The data again are crude in the early period and the wage rate corrections made for selectivity bias for various age groups are rudimentary. Nonetheless the magnitudes of the wage and labor activity levels are so large that I find Owen's conclusion quite plausible: "changes in the life-cycle behavior of females [like males] . . . can usually be more readily explained by assuming that women (like men) tend to project current cross-sectional relationships into the future than by positing that they successfully forecast change." Certainly the life cycle hypothesis fits the labor supply behavior of the 1920 cohort better under such an assumption than under one of perfect foresight. The discussion here would however have been more satisfactory had Owen compared his aggregate findings with the recent work of MaCurdy and others who use panel data sets.

Owen also attempts to establish the value of a composite labor activity measure, labor input per capita, that combines labor force participation and hours per week of workers in multiplicative form. He presents no theoretical justification for this variable nor does he identify any previously unrecognized trend in labor behavior based on it. Indeed the series he compiles do offer a different perspective on several labor trends, but Owen does not call attention to them. The large increase in labor force participation of adult women, for example, is considerably moderated when multiplied by weekly hours because a great deal of the increase has been among part-time workers. Conversely the labor supply contraction of teenage males in the U.S. over this period has been much larger than labor force participation rates would suggest since the prevalence of part-time work has increased for this group as well.

The text discussion is nontechnical with discussions of the simple models considered here relegated to appendices. The book should be accessible to upper level undergraduates; the rather heavy use of professional jargon may make it somewhat unsatisfactory in that role. I suspect that its main value will be to remind labor economists of the interrelationships of the broad trends in labor activity that have occurred over this period. Even a specialist will find

much that is interesting and thought provoking.

LABOR-MANAGEMENT RELATIONS

*The conflicts between labor and environmentalism in the Federal Republic of Germany and the United States.* By HEINRICH SIEGMANN. New York: St. Martin's Press, 1985. Pp. viii, 201. \$27.50. ISBN 0-312-16236-7.

JEL 86-0591

As the title of this book implies, the author addresses the question "whether and under what conditions . . . labor-environmentalist conflicts indeed are inevitable; or whether, and how, the two movements could cooperate more" (p. 1). Having posed his question about conflicts and cooperation between organized labor and environmentalist groups, Dr. Siegmann then considers five hypotheses about the labor-environmentalist relation: (i) that conflict is inevitable since there is a contradiction between pursuing employment and environmental protection goals; (ii) that differences in the demographic and socioeconomic composition of the two movements prevent cooperation; (iii) that differences in the internal organization of unions and environmental groups favor conflict; (iv) that national political systems impede cooperation; and (v) that opposing ideologies favor a conflictual relationship.

In his investigation of these five hypotheses, the author uses what one might call a comparative-historical-institutional approach. That is, he selects the United States and the Federal Republic of Germany (F.R.G.) as test cases and then looks at their experiences during the past two decades. These two nations share a number of important characteristics: advanced capitalist economies, federal political systems, energy problems during the 1970s, etc. At the same time, however, they are different in important respects: a more unionized labor force in the F.R.G., parliamentary government in Bonn, codetermination rights and industry-wide bargaining for German unions, and so forth. Hence, the author's method permits him to explore whether the hypotheses hold under similar, but somewhat different, political-economic

circumstances. In an effort to empirically test the five hypotheses, Dr. Siegmann has assembled an ingenious array of descriptive statistics for the two countries: standard economic statistics, results of public opinion polls, content analyses of labor and environmentalist documents, ratings of voting records of members of Congress, and demographic survey data.

After reporting these data, the author reaches a number of interesting conclusions. One is that, although there was some conflict between organized labor and environmentalists in both countries during the 1970s (especially over nuclear power development), the political positions of the two groups have converged during the 1980s, even during periods of recession. In the F.R.G., one apparent reason for this convergence is that some unions perceive that *environmental protection and energy conservation* projects are net creators of job opportunities. Another interesting conclusion is that, although there are substantial differences in the demographic and socioeconomic profiles of the members of labor unions and environmental groups, this does not account for labor-environmentalist tensions since there is broad popular support for environmental protection in both countries. A third conclusion worth noting is that a nation's political system can have a substantial impact on the exact form which environmental activism takes: The close alliance between West German unions and the Social Democratic Party and the relative insulation of parliamentary parties from interest-group lobbying has apparently channeled West German environmentalists into local organizations and prompted the formation of an ecological political party, whereas U.S. environmental organizations tend to be nationally-based lobbying groups which are also active in civil litigation.

Before mentioning a few shortcomings of this book, let me first note an important strength. Dr. Siegmann is to be commended for avoiding the potential trap of economic determinism. He skirts this methodological pitfall by emphasizing that historical outcomes depend upon strategic choices, efforts at coalition-building and unanticipated shifts in ideology and hence cannot be predicted by simply looking at individuals' "economic interests." Having said this, however, I should add that the author's discussion

of ideology is quite weak, in particular his claim that the left-right political spectrum is outmoded and that a materialist-postmaterialist continuum is now more useful to the political analyst. His focus on labor unions as a unit of analysis is also theoretically constraining since he pays almost no attention to the potential for conflict and cooperation among workers as a social class, whether or not they belong to unions. His discussion of potential conflicts between economic interests and environmental protection is also dissatisfying since he mentions the perceived employment effects of environmental and energy policies but ignores the distribution of benefits of environmental improvement as well as the incidence of the costs of financing environmental protection measures, issues which I have recently addressed (1986, ch. 7) elsewhere. Despite these criticisms, I would recommend Dr. Siegmann's book as an empirically rich source on the political economy of labor unions and environmentalism.

RONALD D. LEE with PAULA E. HOUTENBACH  
AND JOHN BONGAARTS. *Studies in Population*  
series. New York, London, Sydney and Toronto:  
Harcourt Brace Jovanovich, Academic  
Press, 1983. Pp. xvii, 642. \$37.00. ISBN 0-  
12-140501-X. JEL 85-0587

How one views high rates of population growth in low-income countries and, in particular, whether they are seen as a problem depends on how one evaluates the consequences of population growth. Some analysts see rapid population growth as a brake on economic development, depressing or at least slowing a rise in living standards by diverting resources that could be employed to raise levels of living to uses designed to accommodate an expanding

population. It is this view that provides the rationale for this study, and because there are continued pressures to reduce mortality and because international migration contributes little to population growth in developing areas, attention is focused on fertility as the key policy variable.

The two volumes that comprise *Determinants of Fertility* (only the first of which is discussed here) review the research evidence about determinants of fertility differentials and fertility change in the developing countries. Following an analytic framework set out in the introductory chapter, the first volume discusses supply and demand for children, and the second discusses fertility regulation and its costs, fertility decisions, nuptiality, and the effects of social institutions. The second volume also contains a summary chapter and an agenda for further research. Both are the work of the Panel on Fertility Determinants of the Committee on Population and Demography, National Research Council, created in response to a request from the U.S. Agency for International Development to assess research in this area and make recommendations for further work.

Volume I is divided into three parts. Part I contains an analytic framework; it is the unifying agent for the volumes' remaining chapters in which individual authors were asked to develop particular aspects of the overarching design. The editors emphasize that Part I is only a framework and not a tightly-knit theory of fertility determinants. There is no formal mathematical model nor any attempt to provide specific predictions of fertility responses to changes in determinants. Instead, Part I aims to develop a comprehensive list of the components that affect human fertility and to specify their interrelationships.

The analytic framework is adapted from the work of Richard Easterlin (1978) and has three basic components: (1) the supply of children—the number of surviving children a couple would have if they made no deliberate attempt at fertility limitation; (2) the demand for children—the number of children a couple desires; and (3) fertility regulation—covering both the means and the costs couples face in converting their fertility desires into actual fertility outcomes. It is assumed that a couple first compares supply and demand, and then considers

the desirability and the costs of fertility regulation. The more supply exceeds demand the more motivated a couple should be to employ some means of fertility limitation. Fertility outcomes depend upon this complex calculus and then feed back to the couple's reproductive history which, along with macro social and economic factors together with the couple's socioeconomic characteristics, help recondition the three basic components for the next round of fertility decision making.

Part II considers the supply of children. It begins with a critical overview by Johnongaarts and Jane Menken and contains five other chapters focusing on natural fertility, the impact of sociocultural factors on breast-feeding and sexual behavior—both of which affect natural fertility, and child mortality, which drives a wedge between the supply of births and the supply of living children. Part III treats the demand for children and begins with a critical essay by Ronald Lee and Rodolfo Bulatao. This first chapter discusses the concept and measurement of demand followed by an examination of the major influences on demand, including the direct economic costs and benefits of children, opportunity costs, tastes and preferences for children, effects of income and wealth, and prior childbearing and childrearing experiences. Other chapters in Part III round out this critical essay by focusing on family-size desires as measures of demand, child mortality as it relates to the difference between the demand for children and the demand for births, community-level determinants of demand, such price variables as the perceived and actual economic costs and benefits of children and the opportunity cost of the mother's time, and the effects of income and wealth on demand.

This book will stretch the horizons of most economists interested in the determinants of fertility. The analytic framework is broadly multidisciplinary—drawing on work in economics and public health, in psychology and anthropology, and in sociology and statistics—rather than narrowly economic. In fact, of the 21 authors in volume I, only 4 are economists—Ronald Lee, Peter Lindert, Eva Mueller, and Kathleen Short. Moreover, the framework goes considerably beyond the perspective of the new home economics approach to fertility, illustrated, for example, in the *Economics of the Family* vol-

ume edited by Theodore Schultz (1974), by introducing supply factors and the costs of fertility regulation.

Readers expecting to find well-developed theoretical models, followed by rigorous empirical tests and reports of regression estimates, will be disappointed. Though the individual chapters are broadly empirical and contain frequent tables and charts, most empirical results are discussed but rarely shown. Indeed, apart from the appendix to one of the chapters, there are just four equations in 642 pages of text. What this volume does, however, is provide the reader with much of the richness and complexity of the fertility process so that subsequent model builders will be in a better position to realign their sights. *Determinants of Fertility* deserves to be read and studied. The expected return is well worth the effort.

*Medical malpractice: Theory, evidence, and public policy*. By PATRICIA M. DANZON. Cambridge, MA and London: Harvard University Press, 1985. Pp. vi, 264. \$17.50. ISBN 0-674-56115-5. JEL 86-0289

*Medical Malpractice* by Patricia Danzon is instantly the standard work in the field and an important work in the economics of tort liability. Professor Danzon takes pains carefully to analyze and lay bare the structure of a difficult social problem. *Medical Malpractice* is an indictment of medical practice, the insurance industry, the legal system, and the political system, yet it maintains a tone and affect of balanced academic inquiry that causes the

reader to wonder whether the author sees her work as the indictment that it is.

Professor Danzon's work stands practically alone in this extremely important field. The best data we have on medical malpractice today were generated twelve years ago from an isolated California study where medico-legal experts analyzed a large sample of iatrogenic problems and counted those which would have resulted in malpractice claims, if they had been brought to trial. If the problem of medical malpractice is as serious as Professor Danzon's work would lead us to believe, such data should be gathered on a regular basis wherever medicine is practiced, and analyzed regularly by doctors, hospital boards, insurance companies, economists, and politicians.

Professor Danzon's book can be interpreted as trying to come to grips with one startling fact: "... at most 1 in 25 negligent injuries resulted in compensation in the malpractice system" (p. 24). Her general position is that in a system where there is so much negligence, even costly deterrence through the legal system is likely to be worthwhile. Some of her suggestions would go a long way toward reducing the costs of litigation, making it a much less costly method of deterrence. She recommends replacing traditional full compensation determined on an individual basis with a schedule of limited benefits, including: medical expenses comparable to coverage provided by private health plans; full replacement of lost wages; offset of private medical expenses; no compensation for all private medical expenses and Medicare and Medicaid; no responding part of medical expenses; offering compensation for pain and suffering in injuries only; and strict rules for determining inflation, interest rates, and growth parameters.

I feel that the author underplays the importance of these recommendations, all of which would help counteract the worst tendencies of the tort system. For example, litigation of pain and suffering brings out the very worst in the adversary system: movies on a day in the life of a paraplegic, postponement of treatment until after a trial, all kinds of biases in favor of attractive plaintiffs. Even more important, the variability and unpredictability of the outcome of litigation can be greatly reduced, thereby

substituting settlements for litigation, and deterrence for anxiety.

Professor Danzon provides a thoughtful discussion of the various possible reforms of litigation costs. When she says, on page 207, "neither theory nor evidence gives us much guide for reform," her modesty on our behalf is well placed. I disagree with her traditional economic analysis of the contingent fee; I fear that we know much less about that peculiar institution than she suggests. A survey conducted by the Federal Trade Commission suggests that the plaintiff's bar hardly ever practices on an hourly rate basis, even for an open-and-shut case. It also found that 33 percent is one of the eternal constants of the American economy. Ordinary economic theory does not adequately explain such remarkable pricing inflexibility, nor can we be confident about any welfare economics inferences in a market with such peculiar pricing.

Professor Danzon recommends freedom to contract out of standard tort rights, particularly in the context of a standard insurance contract. She is absolutely correct. Malpractice is a problem that arises between parties related by contract. These are not strangers bumping into one another in the street. Other aspects of their relationship are carefully controlled by contract. There is no reason to believe that if insurance contracts could explicitly deal with these matters that they would freely choose the bizarre procedures and results that characterize the tort approach to malpractice. If nobody wants it, no one will choose it.

Public discourse on malpractice has been depressingly unenlightened as to economics. Economists have not played a significant role in the public debate on medical malpractice or on tort reform in general. Professor Danzon's work is an important step in bringing economic analysis to bear on public policy toward medical malpractice, and every economist interested in either medical economics or law and economics should become familiar with it. Indeed, lawyers, doctors, and citizens interested in social policy should read the book. *Medical Malpractice* provides a common ground of data and interpretation that these often warring factions can share, understand in their different ways, and use to advance the common cause of reducing the huge costs of medical malpractice.

I expect, however, that most of the people who should read the book will not. It is intensely scholarly, and at times more dense and less approachable than it needed to be. Professor Danzon deserved more support from the editor and the Harvard Press in terms of more graphs and charts to simplify and focus the discussion of table after table of data. What was occasionally heavy going would have been lightened for this reader if the technical analysis had been relegated to appendices for the intrepid, with only central charts or graphs left in the text for the main body of the readership.

JOHN PRATHER BROWN

*Chase, Brown, & Blaxall, Inc.*

*From health dollars to health services: New York City, 1965-1985.* By ELI GINZBERG ET AL. LandMark Studies series, Totowa, NJ: Littlefield, Adams; Rowman and Allenheld, 1986. Pp. xii, 163. \$29.50. ISBN 0-8476-7440-1. JEL 86-0943

The introduction of federal government financing of health care in 1965 through the Medicare and Medicaid programs has had a tremendous impact upon the American health care system. The enlarged flow of dollars to the health care system has increased access to services for the elderly and the poor and has increased funding and reimbursement of providers such as hospitals and physicians. By increasing the proportion of expenses financed by insurance, Medicare and Medicaid also have augmented the distortions in the health care system which are so familiar to health care economists.

In this book, Eli Ginzberg and his associates examine the impact of increased federal funding of health care upon the recipients of health care services and the providers of the services in New York City. The authors' main purpose is to document how the new dollars were transformed into more and better services in the two decade period, rather than to analyze whether government spending was an efficient method to achieve these goals. Consequently, even though the authors' assessment of the value of Medicare and Medicaid and their forecasts of changes in the health care system may not meet the full approval of market-oriented health care economists, they do provide a comprehensive summary of what transpired in New

York City. In as much as the New York market is representative of developments in the whole country, the scenario surveyed here will be of considerable interest to both practitioners and economists.

Chapter 1 comprehensively summarizes the contents of the book and convincingly establishes why it is worthwhile to examine the New York market. New York City has long been a leading center for medical education with six academic health care centers and publicly financed a substantial municipal hospital system to provide care regardless of ability to pay long before the advent of federal government financing. In addition, the City has witnessed dynamic population changes, has had a strong trade union movement, experienced a serious financial crisis in the mid-1970s, and has had a rich tradition of philanthropy. These factors make it a particularly interesting market to examine closely.

Chapter 2 documents the cascade of dollars flowing to New York City after 1964. The authors cite increased funding from all sources and adjust for inflation. In Chapters 3-7, the main body of the book, the authors trace the impact of the increased dollars upon various parts of the health care system. Chapter 3 provides a good description of the changes in voluntary, municipal, and proprietary hospitals. The discussion focuses on increases in expenditures rather than on quantitative measurement of the improvement of the quality of care, but the authors argue that such a large increase in the quantity of real resources devoted to health care could not have failed to improve the quality of care.

Chapter 4 is devoted to case studies of the evolution of two hospitals, St. Vincent's and Montefiore. The in-depth treatment of the effect of the changing environment upon these two hospitals is probably the most interesting part of the whole study. However, it is difficult to derive generalizations from these two cases. Chapter 5 documents the support of the health care sector by the city and the state and describes changes in various services. The effect on physicians is the subject of Chapter 6. Among the most important impacts discussed are the decline in the number of physicians

providing voluntary care to the indigent, the appointment of salaried physicians to teaching hospitals, and the greater responsibility assumed by residents. The discussion of physician incomes should have been more extensive. Chapter 7 is a sympathetic treatment of the unionization of health care workers. There are interesting discussions of the development of unions, strikes, effects of changing racial mixes, and the effects of changing government financing.

In Chapter 8, an assessment of the increased government financing of health care is made. The authors conclude that the principal beneficiaries were the elderly, the poor, and those who needed very expensive treatments, but the whole population gained access to more sophisticated care. Academic health centers prospered. Providers, especially physicians, did well.

The final two chapters deal with lessons for the future and the changing health care system. The authors reiterate that Medicare and Medicaid resulted in more and better health care, but argue that neither proponents nor opponents considered the inflationary effects increased government spending on health would have. The authors say that "voluntary programs removed costs from the system; however, they do not remove the cost of the health care system." They believe that a cost containment program for health care. Judges do not believe that the impact in New York City. The DRG (Diagnosis-Related Group) program and its possible extensions will affect New York hospitals.

In the current environment the cost/benefit trade-offs of government spending are being closely examined. Although it does not adequately deal with this issue, this volume by Ginzberg and associates will prove to be valuable reading for economists interested in the impact of massive government spending on health care. Many lessons can be learned from this detailed examination of the experiences in New York City.

*The perception of poverty.* By ALDI J. M. HAGENAARS. Contributions to Economic Analysis series, no. 156. Amsterdam and Oxford: North Holland; distributed in the U.S. and Canada by Elsevier Science, New York, 1986. Pp. xv, 301. \$43.00. ISBN 0-444-87898-X. JEL 86-0944

It may come as a surprise to some readers that in many of the so-called "welfare states" in Europe research into the causes and consequences of poverty is a virtually neglected activity among economists and other social scientists. Most European countries do not measure on a regular basis the size of the population below an official poverty line, or judge the merits of social programs by what these programs do for the official poor. In contrast, in the U.S., especially since the war on poverty, "the poor" are an officially defined group, poverty statistics are produced on a regular basis and a blossoming research industry exists, focusing on poverty and the poor.

Professor Hagenaars' stimulating book provides something for both European and U.S. economists: it reviews many of the conceptual and empirical issues to be dealt with when doing poverty research. As such it is a very useful introduction for European economists to the literature on poverty, which stems mostly from the U.S. The book also applies, in eight European countries (Belgium, Denmark, France, West Germany, Ireland, Italy, The Netherlands and the United Kingdom) an innovative new way to measure poverty, indeed to measure a household's welfare level in general. As such, it provides food for thought for U.S. scholars to whom some of the review chapters may seem a bit too familiar.

The book can be divided in two parts: Chapters 1 through 6, that review many of the conceptual issues and introduce the new methodology; and Chapters 7 through 13 that describe the data and the empirical results. Being poor is defined as having a welfare level that is below a given cutoff point; welfare is defined as having command of resources and is operationalized as a function of total after-tax household income. The new methodology employed in this book deals with the measurement of this welfare function. The necessary information is obtained by asking respondents the following question:

Under my (our) conditions I would call an after-tax income of:

about \$_____	very bad
about \$_____	bad
about \$_____	insufficient
about \$_____	sufficient
about \$_____	good
about \$_____	very good

Thus the respondent's welfare evaluation of income is measured *directly*, with the aid of this "subjective" question. Though the use of subjective questions is very common in other social sciences, it is rare in economics. Still the question itself has a straightforward economic interpretation: it measures six points on a household's minimum cost function, the inverse of the direct utility function (how much does it cost to reach utility level "good"). It is a pity that the author does not spell out this direct link to the more standard neoclassical literature on household behavior. It would have helped the reader to relate the discussion more easily to the existing literature and it may have clarified some of the more confusing parts of the book (see below).

Armed with six direct observations of a household's "Welfare Function of Income" (WFI, in the author's terminology), this function can be estimated for each household. Based on van Praag's theoretical work (van Praag 1968) and subsequent empirical validations (e.g., van Herwaarden and Kapteyn 1981), the functional form chosen is that of the two-parameter log normal function. Subsequently, these two parameters can be related to various household characteristics (like family size) and nominal household income can be adjusted to obtain a welfare measure that allows one to compare welfare levels among households that live in different areas, have more or fewer children, one or two earners, etc.

In general, the author is very careful in stating which hypotheses have to be made at each step in order to obtain this welfare measure. For instance, the mean of the WFI is likely to differ between a one-earner and a two-earner household. While discussing this, the author carefully avoids reference to leisure as a poten-

tial source of welfare. After all the welfare concept discussed and measured is welfare derived from income. Unfortunately, while discussing the effect of having more children, the author introduces "parental joy," "children as consumption goods" and "taste and preference changes when a child is born" into the discussion. The first two issues suggest erroneously, that the welfare concept used is much wider than explicitly stated by the author and presumably measured by the question. The third issue brings up the question how far one is willing to go when household income is being adjusted for different circumstances. Larger needs (more mouths to feed), higher prices in urban areas and reduced home production or increased cost of working seem rather uncontroversial reasons to adjust nominal income. But if taste and preference changes are also acceptable, everyone will be poor who says that he is poor, irrespective of income or other factors.

This of course, does not discredit the new method itself. The same problem will occur if, for instance, careless use is made of the food share as a welfare indicator (everyone is poor who spends "too much" on food). But it does suggest that one has to be extremely careful in interpreting what aspect of welfare is actually measured by this direct method, and how and for what purposes this welfare measure can be used.

The second part of the book is a joy to read if empirical work has a large weight in one's overall welfare function. Based on identical household surveys conducted in eight countries of the European Economic Community (a logistical accomplishment of some magnitude), the author presents average welfare levels for a dozen different household types followed by analyses of income determinants, of the welfare parameters obtained and, finally, of the determinants and extent of poverty. One is at once struck by the consistency of the results across such different countries as well as by the observed differences. The chapters are very rich both in straightforward information and in analytical results. They make this book a major contribution to the study of poverty and—more generally—to the study of welfare related issues in Europe.

Much remains to be done. For instance, the differences among countries are likely to be re-

lated to the countries' socioeconomic infrastructure and welfare systems, something that needs to be worked out in much greater detail than is currently done in the book. But much has been done, and the results should stimulate European economists to expand their study of the causes and consequences of poverty. One can only hope that enough U.S. researchers read this book and become interested in applying the new methodology. It should be very easy, and inexpensive, to add one or more of these subjective income evaluation questions to various ongoing survey activities. (The Survey of Income and Program Participation, SIPP, may be a good candidate). That would open up possibilities for comparative research that may lead to the cross-validation of conventional "objective" welfare measures and the new "subjective" ones. As it stands, the book deserves much attention on both sides of the Atlantic.

*Advanced industrial develop-*

*ing, relocation, and renewal.* By DONALD A. HICKS. Lincoln Institute of Land Policy Book/OG and H series. Boston: Oelgeschlager, Gunn and Hain in association with the Lincoln Institute of Land Policy, 1985. Pp. xx, 321. \$35.00. ISBN 0-89946-196-4.

JEL 86-1286

In this book Donald Hicks seeks to demonstrate that the American economy has entered an era of development rather than one of decline, even though since the late 1970s or early 1980s "slow or no growth" has become "a common feature across several industries whose very expansion had (previously) defined the development of our industrial economy" (p. 3). This new era of "advanced economic develop-

ment" is characterized by fundamental restructuring and spatial repositioning of firms and industries.

Chapter 1 sketches the major arguments and presents summaries of the chapters to follow.

Chapter 2 focuses on reinterpreting evidence which has been frequently held to indicate industrial decline. Hicks makes several points: that the new era is associated with a transition from one set of production arrangements to another with no significant loss of a central role of goods production; that recessions may offer opportunities to accelerate this transition; and that there is, on balance, no evidence of any significant effect on income distribution, although the nature of work is being fundamentally transformed as we move from activities involved in physical production to an emphasis on creating, communicating and applying information.

Chapter 3 deals with the nature of industrial adjustment. The principal conclusion is that in the new era the most important changes are occurring *within* industries and firms as they restructure and relocate activities and as industrial subsectors experience unequal rates of growth. Arguing against the view that investment targets chosen by management to maximize profits bring socially undesirable results (the "capital versus community" position), he sees the system as responsive to the challenge of new technologies. "Restructuring, relocation, and renewal emerge as important competitive strategies as industrial activity filters out of old and into new physical settings, corporate structures, labor relations environments, and production technologies regimes" (p. 13). Evidence of the way those readjustments take place is found in an earlier study by the author of the transformation of the U.S. metalworking sector and in a brief review of the experience of two industries (one old and one new), steel and computer software.

Chapter 4 treats industrial and population location shifts among multistate regions, between metropolitan and nonmetropolitan areas, and within metropolitan areas. Hicks observes that locational changes have resulted in convergence in industrial structure among regions and to some extent between metropolitan and nonmetropolitan areas but have not as yet appreciably lessened the affinity of manufacturing for

metropolitan areas. Within metropolitan areas he observes a general tendency toward dispersal away from central cities and the development of multiple nodes of activity. As regards older central cities he sees population and employment contraction as processes that are reshaping form and function in a manner analogous to the way in which the processes of growth shaped urban economies in an earlier era.

Chapter 5 explores the local-regional features of industrial development by citing Hicks' earlier studies of high technology in the Texas economy, focusing largely on computer services. Although these new industries have relatively few locational constraints, heavy reliance on pools of appropriately skilled workers has resulted in firms locating principally in the largest metropolitan areas. Within the Dallas metropolitan area the large majority of computer service firms operate within the city of Dallas, and over the years relocation has tended to correspond to the larger patterns of change in real estate, residential and commercial development. Finally, an analysis of a succession of high tech firm cohorts starting up in the Dallas-Ft. Worth area from 1960 to 1980 reveals certain tendencies for dispersion and for greater job generation to occur as a result of small firm activity than large, although large firms continue to account for the bulk of total employment.

Chapter 6 treats the agricultural revolution, which Hicks sees as accompanying the new industrial revolution and as going far beyond earlier mechanization in altering production functions, especially in liberating agricultural production from traditional locational constraints.

Chapter 7 examines the difficulties faced by the local public sector under conditions of changing residential and commercial patterns of location. The central focus is on the heavy dependence of local governments on the property tax and the increasing constraints on the extent to which the current tax system can be expected to generate adequate revenues.

Essentially Hicks' analysis proceeds at two levels. The first is a highly optimistic interpretation of the recent experience of reduced growth and apparent industrial decline as one of restructuring and repositioning, resulting in com-

petitive strengthening of the economy and a clear net social gain. The other is a selective empirical analysis of locational rearrangements of firms and industries with special reference to large metropolitan areas.

At the first level, Hicks offers a suggestive, even provocative, interpretation of current development. Development is seen as a process of ceaseless change in which the economic health of a city or region is equated with its capacity to adjust. Yet development in the new era as well as the old proceeds in a highly uneven fashion, favoring some industries and firms as well as regions, cities and groups of workers while leaving others in distress over protracted periods. Hicks' failure to examine

in any depth the rise of services (especially producers' services) and the increasing internationalization of business, along with a more general failure to explain why the old era of growth was replaced by the new, leaves us with little guidance as to how to cope with such change. It is unrealistic to anticipate that an affluent democratic society will long tolerate such inequities without demanding some ameliorating public policy.

At the second level, the empirical analysis based on close observation of certain aspects of development within the Texas economy makes a useful contribution.

# Annotated Listing of New Books

## Editor's Note

Our policy is to annotate all English-language books on economics and related subjects that are sent to us. A very few foreign-language books are called to our attention and annotated by our consulting editors or others. Our staff does not monitor and order books published, therefore, if an annotation of a book does not appear six months after the publication date, please write to us or the publisher concerning the book.

An index to the *Annotated Listing of New Books* will appear at the end of the *General Index* in the December issue.

## 000 General Economics; Theory; History; Systems

### 010 GENERAL ECONOMICS

DA, S., ET AL. *The science and praxis of complexity: Contributions to the symposium held at Montpellier, France, 9-11 May, 1984*. Tokyo, United Nations University, 1985. Pp. viii, 384. \$25.00, paper. ISBN 92-808-560-6. JEL 87-0340

Twenty-five papers from a symposium on the nature and behavior of complex dynamic systems and the phenomenon of complexity. The first section discusses various epistemological and theoretical aspects of complexity, such as simplifying complexity, the definition of complexity, the pervasiveness of complexity, and complexity and meaning. The second section comprises five papers written by practitioners from the point of view of their respective disciplines, including complexity and causality, consequences of complexity in economics, complexity of interdependence in living systems, and quanta and relativity. Section three deals with the complexity of natural systems, relating to society and the environment, complexity of ecological systems, and a concept of ecotechnology. Section four discusses complexity in the social sciences and its importance in political decision making, including complexity in sociology, management of complexity, and complexity and democracy. Concludes with an overview that charts the facets of complexity. No index.

CRNS, RALPH T. AND STONE, GERALD W. *Economics*. Third edition. Glenview, Ill., and London: Scott, Foresman, [1981, 1984] 1987. Pp. xxvi, 796. \$29.00. ISBN 0-673-16675-9. JEL 87-0341

Third edition of this introductory textbook in economics has been reorganized and revised to incorporate recent events and data. [See JEL no.

84-0632 for annotation of second edition.] Includes a discussion of the law and economics, Gramm-Rudman tax bill, structural versus cyclical deficits, industrial policy, and international variations in the velocity of money. The authors are at the Metropolitan State College and the University of Colorado at Denver. Glossary, name and subject indexes.

CLOSE, ARTHUR C. AND GRIGG, JOHN P., eds. *National directory of corporate public affairs*. 1987. Fifth edition. Washington, D.C.: Columbia Books, [1983] . . . [1986] 1987. Pp. 507. ISBN 0-910416-62-1.

Provides a profile of the public affairs profession in the United States, lists the names of people and includes a directory of organizations from which the information was collected. Contains a year-long review of the profession and lists sources available to the profession. The first is an alphabetical listing of 1,500 companies identified as having public affairs programs. Includes, where possible, address of the corporate headquarters, Washington address, political action committee, foundations, and publications. Summarizes philanthropic and public affairs activities. The second part is an alphabetical listing of some 11,500 corporate officials engaged in informational, political, and philanthropic activities. Also contains industry and geographic indexes.

EKINS, PAUL, ed. *The living economy: A new economics in the making*. London and New York: Routledge and Kegan Paul, 1986. Pp. xxiii, 398. \$49.95, cloth. \$15.95, paper. ISBN 0-7102-0946-0, pbk. JEL 87-0343

Thirty-nine essays resulting from the work of The Other Economics Summit (TOES), an independent, international initiative, seeking to de-

velop and promote a New Economics, based on personal development and social justice, the satisfaction of the whole range of human needs, sustainable use of resources and conservation of the environment." Most of the contributions are drawn from two TOES conferences in 1984 and 1985. Part 1 focuses on conventional economics' "obsession with economic growth." Papers discuss North-South issues, international debt, arms trade, and health implications. Questions current indicators of economic progress, such as the GNP. Part 2 presents a more detailed description of the philosophy of TOES. Part 3 presents plans for action, emphasizing increasing access to land, the use of cooperatives, and a new order of industrial priorities. Ekins is Director of The Other Economic Summit (TOES) and is an electrical engineer. Bibliography; index.

HILDRETH, CLIFFORD. *The Cowles Commission in Chicago, 1939-1955. Lecture Notes in Economics and Mathematical Systems series, no. 271.* Berlin; New York, London and Tokyo: Springer, 1986. Pp. 176. \$19.30, paper. ISBN 3-540-16774-9.

JEL 87-0344

A report on work conducted by the Cowles Commission for Research in Economics between 1939 and 1955. Reviews changes in the organization of the Commission. Outlines the work on simultaneous equations and covers the developments in the probability approach, identification, estimation and testing, applications, and theory and applications. Discusses research in activity analysis and related topics and later extensions and applications of work conducted by the Cowles Commission. Hildreth is a faculty member in the Department of Economics at the University of Minnesota. Index.

MANSFIELD, EDWIN AND BEHRAVESH, NARIMAN. *Economics USA.* New York and London: Norton, 1986. Pp. xvi, 593. \$29.95. ISBN 0-393-95508-7.

JEL 87-0345

Adaptation of the fifth edition of the introductory-level textbook, *Economics: Principles, Problems, Decisions*, by Edwin Mansfield. Basis of a multimedia education project developed under a grant from an Annenberg/Corporation for Public Broadcasting Project that integrates text, video, and audio; broadcast as a PBS television series. Can be used to accompany the telecourse, "Economics USA," or as a text in a traditional one-semester survey lecture course. Designed to use economic events in past and present U.S. history to teach basic principles; incorporates case studies throughout. Organized as follows: introduction; national income and output; money, banking, and

stabilization policy, economic decision making (firm, consumer, and society); distribution of income, and growth, the government, and international economics. In addition to the textbook, the elements of the complete telecourse include: a 28-part television series, telecourse study guide, text review guide, 28-part audio series, faculty manual, and test bank. May also be adapted for a two-semester principles course. Mansfield is Professor of Economics and Director, Center for Economics and Technology, University of Pennsylvania. Behraves is Vice-President of U.S. Services, Wharton Econometric Forecasting Associates, Philadelphia. Glossary; index x.

MASON, EDWARD S. *The Harvard Institute for International Development and its antecedents.* Monographs on Development series. Cambridge, Mass.: Harvard University, Harvard Institute for International Development, Lanham, Md.: University Press of America, 1986. Pp. x, 97. \$8.50, paper. ISBN 0-8191-5553-5. JEL 87-0346

An account of the antecedents of the Harvard Institute for International Development. Covers its early years as the Harvard Advisory Groups and the Development Advisory Service and describes the nature of teaching, research, and project formulation and appraisal. Also describes the overseas projects, teaching, and research conducted by the Harvard Institute for International Development. Mason is Thomas W. Lamont University Professor Emeritus, Harvard Institute for International Development. No index.

MCCLOSKEY, DONALD N. *The writing of economics.* New York: Macmillan; London: Collier Macmillan, 1987. Pp. viii, 63. Paper. ISBN 0-02-379520-4.

JEL 87-0347

Brief guide offering advice to improve clarity and readability in the writing of economics. Illustrates how the factual rules of rhetoric, style, grammar, punctuation, organization, word selection, and rewriting can contribute to the development of better writing skills for economists and social scientists. An earlier version appeared in the April 1985 issue of *Economic Inquiry*. McCloskey is Professor of Economics and of History, University of Iowa. Index.

QUARLES, SUSAN D., ed. *Guide to federal funding for social scientists.* New York: Russell Sage Foundation, 1986. Pp. xi, 382. \$19.95. ISBN 0-87154-699-X, pbk. JEL 87-0348

Prepared by the Consortium of Social Science Associations. Purpose is to introduce new scholars to the various federal agencies that provide funding for research and training, and to inform established

scholars of alternative funding opportunities in federal agencies. Intended to serve individual academic researchers, nonacademic administrators and researchers, student advisors, and professional groups. Contains nearly 200 separate entries describing over 300 federal programs. Most entries contain names of appropriate contact persons, budget information, application and review procedures, funding mechanisms, and examples of funded projects. Also describes program's interests and priorities, the structure and organization of the social sciences in the federal funding arena, including descriptions of the relevant professional associations in various fields. Discusses academics and contract research, pointing out the importance of preparation, the proposal process, and details after a contract is awarded. Also contains some inside views of selected federal research funding agencies. The major portion of the Guide describes the many federal sources of research support. Also lists the five major federal statistical agencies and their data collections as well as federal and nonfederal information sources. Quarles is with the Consortium of Social Science Associations. Topical index; listing of fellowship and research awards.

SCITOVSKY, TIBOR. *Human desire and economic satisfaction: Essays on the frontiers of economics*. New York: New York University Press, 1986. Pp. xii, 209. \$45.00. ISBN 0-8147-7862-3.

JEL 87-0349

Fourteen papers (most previously published) deal with the relationship between economics and psychology. Part 1 is devoted to welfare and its distribution, and includes a discussion of inequality and the relationship between economic and human welfare. Part 2 explores rationality and its links to the Puritan ethic. Part 3 discusses the survival of capitalism and deals with a benefit of monopoly capitalism. Part 4 contains several papers related on the nature of economic progress, discussing changes in consumer tastes, the desire for excitement and for job importance, subsidies for the arts, the economy's impact on family and social relations, and the use of psychology in the history of economic thought. Scitovsky is Professor of Economics Emeritus, Stanford University. Name and subject indexes.

[SELDON, ARTHUR] *The unfinished agenda: Essays on the political economy of government policy in honour of Arthur Seldon*. Edited by MARTIN J. ANDERSON. London: Institute of Economic Affairs, distributed in North America by Transatlantic Arts, Albuquerque, New Mexico, 1986. Pp. xii, 152. \$15.95, paper. ISBN 0-255-36191-2.

JEL 87-0350

Collection of eleven essays in honor of Arthur Seldon's seventieth birthday, presenting a survey of liberal and neo-liberal economic thinking on the scope and limitations of government and the role of markets in formulating policy. Reviews Seldon's contributions over the past thirty years. The papers discuss: the need for advances in public choice theory; the welfare-redistribution policy dilemma since the end of World War I, the power of labor unions; the new anti-trust economics; the ideas and influence of Sir Arnold Plant, the contributions of Austrian economics; the importance of rational expectations in macroeconomics, the success and failure of econometrics, the success or failure of liberalism in the United States and Britain; and the moral imperative of the market. Anderson is with the Institute of Economic Affairs, London. No index.

## 020 GENERAL ECONOMIC THEORY

BENASSY, JEAN-PASCAL. *Macroeconomics. An introduction to the Non-Walrasian approach*. Economic Theory, Econometrics, and Mathematical Economics series. Orlando, Fla., London, Montreal and Tokyo. Harcourt, Bract, Jovanovich, Academic Press, 1986. Pp. xiii, 250. \$26.95, paper. ISBN 0-12-086426-6.

A review of non-Walrasian macroeconomic for microeconomic for macroeconomic model only macroeconomic pact of various wages and prices models and discuss to combat unemployment ance of payments. Part 4 consists of dynamic models and covers cost and demand inflation, the Phillips curve, and business cycles. Part 5 incorporates the role of expectations in macroeconomic models and covers non-Walrasian prices and perfect foresight and the employment effects and realism of alternative expectation schemes. Benassy is associated with the Ecole Normale Supérieure, Paris. Bibliography: index.

BOGAN, ELIZABETH CHAPIN AND KILBRAN, JOSEPH J. *Macroeconomics: Theories and applications*. St. Paul, Minn.: West, 1987. Pp. xviii, 569. ISBN 0-314-25867-1.

JEL 87-0352

Intermediate macroeconomics textbook that focuses first on issues and then shows how the different schools of thought help explain them. Emphasizes connections between economics and business

and finance. Special features include explanation of the connection of financial markets to the savings-investment process; discussion of recent institutional changes that affect the nature of, and demand for, money, the motivation behind the tax cuts of 1981 and 1986; and separate treatment of business fluctuations. Examines the perspectives of classicists, Keynesians, monetarists, supply siders, and neo-classicists and neo-Keynesians. Divided into seven parts: an introduction and the circular flow models and national income accounting; classical and Keynesian theory, emphasizing aggregate supply and demand; government, households, and business, finance and money; inflation and unemployment, fluctuations, growth, and policy; and the open economy. Bogan is a Professor of Economics and Kiernan is an Assistant Professor of Economics and Finance, both at Fairleigh Dickinson University. Instructor's manual, test bank, study guide, and transparency masters are available. Glossary, index.

BROWN, C. V. AND JACKSON, P. M. *Public sector economics*. Third edition. Oxford and New York: Blackwell, [1978, 1982] 1986. Pp. xii, 512. \$60.00, cloth; \$24.95, paper. ISBN 0-631-14588-5, pbk.

JEL 87-0353

Third edition of a textbook on public sector economics. Changes from the previous edition include: more recent data on public sector trends, a fuller treatment of the state, the presentation of a theory of public spending growth, a discussion of public sector performance measurement, and revision of the chapters on taxation and poverty. [See JEL no. 83-0403 for annotation of the previous edition.] Name and subject indexes.

BUHL, HANS ULRICH. *A neo-classical theory of distribution and wealth*. Lecture Notes in Economics and Mathematical Systems series, vol. 262. Berlin, New York and Tokyo: Springer, 1986. Pp. 146. \$17.50, paper. ISBN 3-540-16062-0.

JEL 87-0354

Develops a neoclassical model to study the impact of workers' and capitalists' objectives, i.e., the distribution of capital and income in general and its relation to wealth and economic growth. Surveys various models that use differential games to account for these objectives and finds that they show that the noncooperative game element will usually bring about inefficiency if there are no other mechanisms driving the systems toward the cooperative solution. Formulates a discrete economic model to derive and analyze optimal strategies for both worker and capitalist objectives and compares them in the noncooperative and cooperative case. Also modifies the model to consider per

capita values in addition to aggregate values. The concluding chapter discusses the results. Buhl is at the Institut für Wirtschaftstheorie und Operations Research, Karlsruhe University, West Germany. No index.

CHERNIAK, CHRISTOPHER. *Minimal rationality*. Computational Models of Cognition and Perception series. Cambridge, Mass., and London: MIT Press, 1986. Pp. x, 161. \$19.95. ISBN 0-262-03122-1.

JEL 87-0355

A theory of the minimal rationality required to qualify a person as an agent, that is to have a cognitive system of beliefs, desires, perceptions, and actions. Part 1 discusses the conception of a minimal agent including minimal rationality, feasible inferences, and rationality and the structure of human memory. Part 2 is devoted to the epistemological implications of perceiving such a minimal agent as having fixed limits on cognitive resources. Discusses the implications of minimal rationality for the theory of knowledge and for the universal acceptance of "logic," the "special reasons requirement," and the limits for knowledge. Cherniak is a faculty member in the Philosophy Department at the University of Maryland. Index.

COWELL, FRANK A. *Microeconomic principles*. New York: Oxford University Press, 1986. Pp. xi, 413. \$24.95. ISBN 0-19-520536-7.

JEL 87-0356

Designed for advanced students with some background in mathematics. Emphasis is on equilibrium theory. Begins with an analysis of production, followed by a discussion of the firm, the consumer, households, workers, and producers. Analyzes aggregation, general equilibrium, efficiency, and the equilibrium system. Also covers uncertainty, strategic behavior, incentives, and welfare. Throughout, mathematical language is used "... as an expository device and as a powerful method of proof." Reading lists and exercises are included at the end of each chapter. Appendices provide selected proofs and answers to exercises. Cowell is a Reader in Economics at the London School of Economics and Political Science. Index.

DAY, RICHARD H. AND ELIASSON, GUNNAR, eds. *The dynamics of market economies*. Amsterdam and Oxford: North-Holland in cooperation with the Industrial Institute for Economic and Social Research, Stockholm; distributed in the U. S. and Canada by Elsevier Science, New York, 1986. Pp. x, 512. \$65.00. ISBN 0-444-87841-6.

JEL 87-0357

Eighteen papers, comments, and discussion from a conference dealing with the dynamics of decentralized market economies at Saltsjöbaden

near Stockholm in August 1983. Conference was sponsored by the Marcus Wallenberg Foundation for International Cooperation in Science. Papers focus on the workings and growth of decentralized economies and how their performance can best be improved by public policy. The book is divided into four parts: theories and models of dynamic economic systems, technology and innovation; institutions and markets; and general discussion and commentary. The contributors are mainly economists. Day is at the University of Southern California. Eliasson is with the Industrial Institute for Economic and Social Research, Stockholm. Index.

DEBREU, GERARD. *Mathematical economics: Twenty papers of Gerard Debreu*. Paperback reprint. Introduction by WERNER HILDENBRAND. Econometric Society Monographs series, no. 4. Cambridge, New York and Melbourne: Cambridge University Press, [1983] 1986. Pp. xii, 250. \$14.95, paper. ISBN 0-521-33561-2. JEL 87-0358

Paperback reprint. [See JEL no. 84-0019 for annotation. See JEL, September 1984 (Vol. 22, no. 3), p. 1116 for review.]

FARM, ANTE. *A model of the price mechanism*. Swedish Institute for Social Research series, no. 1. Stockholm: University of Stockholm, distributed by Almqvist and Wiksell International, Stockholm, 1986. Pp. 86. \$Skr 86.00, paper. ISBN 91-22-00834-9. JEL 87-0359

A synthesis of modern noncooperative decision theory and the tenets of classical demand and supply analysis for an examination of the price mechanism. Reviews the process of decentralized price setting, discusses noncooperative flexible pricing in a homogeneous market, and provides alternative views of oligopolistic pricing. Covers noncompetitive equilibria in atomistic markets, job search and effective labor supply, and effective labor supply and the optimal wage setting. A doctoral dissertation granted at the University of Stockholm. No index.

GILAD, BENJAMIN AND KAISH, STANLEY, eds. *Handbook of behavioral economics*. Volume A. *Behavioral microeconomics*. Greenwich, Conn., and London: JAI Press, 1986. Pp. xxiii, 352. ISBN 0-89232-700-6. JEL 87-0360

Thirteen papers discuss topics in behavioral microeconomics. Part 1 deals with the methods and tools of behavioral economics. Part 2 is devoted to consumer behavior and discusses developments in consumer behavior research, advertising, and choices with alternatives. Part 3 discusses the theory of the firm and analyzes issues in entrepreneurial and managerial behavior, intrafirm and extra-

firm considerations in productivity, and industrial organization. The contributors are mainly economists. Gilad is Assistant Professor of Management and Kaish is Professor of Economics at Rutgers University, Newark, New Jersey. No index.

GILAD, BENJAMIN AND KAISH, STANLEY, eds. *Handbook of behavioral economics*. Volume B. *Behavioral macroeconomics*. Greenwich, Conn., and London: JAI Press, 1986. Pp. xxiii, 312. ISBN 0-89232-701-4. JEL 87-0361

Thirteen papers address topics in behavioral macroeconomics. Part 1 assesses impact of rational expectations on the analysis of inflation and business cycles and examines the behavioral characteristics of saving behavior. Part 2 deals with the relevance of behavioral insights to the formulation and impact of public economic policy. Part 3 is devoted to an analysis of the role of values and attitudes in the process of economic growth and development. Part 4 considers behavioral analysis of the stock market. The contributors are mainly economists. Gilad is Assistant Professor of Management and Kaish is Professor of Economics at Rutgers University, Newark, New Jersey. No index.

HAMLIN, ALAN P. *Ethics, economics and the state*. New York: St. Martin's Press, 1986. Pp. x, 198. \$32.50. ISBN 0-312-26547-6. JEL 87-0362

Explores the relationships between ethics, economics, and the state. The author's approach involves philosophy, and ethics, as the starting point with individual and the institutional social ethical justification. A critical view of rationalism, five major schools of thought: utilitarianism, Paretianism, liberalism, Marxian ethics. Considers various views of the state, describing alternatives for resolving tensions between rationality and ethics. Hamlin is a Lecturer in Economics at the University of Southampton. Index.

HILLIER, BRIAN. *Macroeconomics: Models, debates and developments*. Oxford and New York: Blackwell, 1986. Pp. x, 225. \$49.95, cloth. \$14.95, paper. ISBN 0-631-11143-X. JEL 87-0363

Intermediate undergraduate textbook examines major theoretical debates that have taken place since the publication of Keynes's *General Theory of Employment, Interest and Money* in 1936; focuses on the issues at stake in the controversies. Prerequisites are elementary algebra and geometry. Part 1 examines the classical model, Keynes's

reasons for denying its validity, and John Hick's IS-LM model as an interpretation of some of Keynes's ideas and as a tool for policy analysis. Part 2 develops the neoclassical synthesis and asks whether Keynes's model is a special case of the classical model dependent on the assumption of money-wage rigidity; also examines the response that the synthesis misrepresents the issues. Part 3 focuses on whether fiscal policy really matters and the roles of wealth effects and the government budget constraint in the "crowding out" debate. Part 4 considers the inflation-unemployment trade-off debate. Part 5 discusses whether macroeconomic policy really matters, i.e., the new classical macroeconomics, the activist-nonactivist debate, and the claim that a predictable, deterministic monetary policy can have no effect on real magnitudes in the economy. Part 6 examines the debate about whether it is possible to set fiscal and monetary policies independently from an exchange-rate target. Hillier is Lecturer in Economics, University of York. Bibliography; index.

[HUTT, W. H.] *W. H. Hutt: An economist for the long run*. Edited by MORGAN O. REYNOLDS. Chicago: Regnery Books, Gateway Editions for and in association with The Heritage Foundation, Washington, D.C., 1986. Pp. 160. \$7.95, paper. ISBN 0-89526-797-7. JEL 87-0364

A Festschrift in tribute to W. H. Hutt whose writings have followed classical economics and are highly critical of Keynes. His major contributions include the development of a comprehensive theory of idle resources, the concept of consumer sovereignty, and a theory of collective bargaining, all with an emphasis on the "free market." Consists of five essays, including two by the editor and one by Hutt on "The Principle of Social Justice." Hutt argues that justice "... is achieved and aggregate income from ownership of the community's aggregate assets is maximized when entrepreneurs are free to purchase assets of given attributes (or the services of assets) at the minimum prices needed to attain them." Other essays include: "Razing Keynes: An Economist for the Long Run" by Thomas Hazlett; "Economists and the Public Revisited" by Arthur Shenfield; "Collective Bargaining or Economic Pluralism" by Ralph Horwitz; and "On the Economics of the Colour Bar" by Morgan O. Reynolds. Also includes an interview with W. H. Hutt by Morgan O. Reynolds. Reynolds is a Professor of Economics at Texas A&M University. Includes a list of Hutt's publications. No index.

MILLER, MERTON H. AND UPTON, CHARLES W. *Macroeconomics: A neoclassical introduction*. Chicago and London: University of Chicago Press, [1974]

1986. Pp. xvi, 367. \$14.95, paper. ISBN 0-226-52623-2. JEL 87-0365

Second edition of a macroeconomics textbook offers an alternative to the standard teaching approach that premises equilibrium with a substantial amount of unemployment. Section one describes the full employment equilibrium path of a growing economy with flexible wages and interest rates. Subsequent sections deal with consumption and saving, government finance, money and the price level, and unemployment. Revised and expanded treatment is given to basic issues such as the work-leisure choice, human capital, consumption-saving decisions, the microfoundations of unemployment, macrotheory of short-run unemployment, the Phillips curve, stagflation, and rational expectations. Miller is Leon Carroll Marshall Distinguished Service Professor in the Graduate School of Business at the University of Chicago. Upton is Associate Professor of Economics at Rutgers University. A version suitable for IBM-compatible personal computers for a "hands-on" model of the underlying text is available. Index.

MOULIN, HERVÉ. *Eighty-nine exercises with solutions from game theory for the social sciences, second and revised edition*. Studies in Game Theory and Mathematical Economics series. New York and London: New York University Press; distributed by Columbia University Press, N.Y., 1986. Pp. x, 156. \$25.00, cloth; \$7.50, paper. ISBN 0-8147-5432-5. JEL 87-0366

Eighty-nine game theory exercises with solutions dealing with two-person zero-sum games; tactical exchanges of information; dominating strategies; sophisticated and perfect equilibrium, Nash equilibrium, stability of Nash equilibria; mixed strategies, correlated equilibrium; coalitional stability; the core; and threats and repetition. No index.

MOULIN, HERVÉ. *Game theory for the social sciences, second and revised edition*. English translation. Studies in Game Theory and Mathematical Economics series. New York: New York University Press; distributed by Columbia University Press, N.Y., [1981, 1982] 1986. Pp. xi, 278. \$30.00, cloth, \$14.50, paper. ISBN 0-8147-5430-9.

JEL 87-0367

Second edition of a graduate textbook presenting the key concepts of strategic game theory. [See JEL no. 83-0018 for annotation of first edition.] Part 1 is devoted to games in which each player has an optimal strategy such that the outcome of the game is deterministic. Part 2 deals with non-cooperative scenarios and covers dominating strategies, sophisticated and perfect equilibria, Nash equilibria and their stability, and mixed strategies.

Part 3 discusses cooperative strategies and covers correlated equilibrium, coalition stability, and threats and repetition. Chapters contain exercises. Accompanied by *Eighty-nine Exercises with Solutions from Game Theory for the Social Sciences, Second and Revised Edition*. Author and subject indexes.

NITZAN, SHIMUEL AND PAROUSI, JACOB. *Collective decision making: An economic outlook*. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. x, 132. ISBN 0-521-30326-5.

JEL 87-0368

Explores the economic implications of a simple theoretic approach to collective choice. Provides a historical account of the basic model and indicates economic implications and applications. Presents the basic dichotomous choice framework, dealing with two issues: optimal decision procedure for a decision making body and characteristics of potentially optimal decision rules. Extends the model and successively relaxes the assumptions, dealing with typical economic considerations, asymmetry between alternatives, interdependence among individual decisions, identifying optimal decision rules, individual decisional competence and majority rule, sequential decision processing, and multiple choice. Concludes with three direct applications of the approach in economics, medicine, and law. Index.

ORDESHOOK, PETER C. *Game theory and political theory. An introduction*. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xv, 511. ISBN 0-521-30612-4.

JEL 87-0369

Introduction to the theory of politics including its central results, its internal logic of proofs, its roots in decision theory/game theory, and the degree to which formal models of political science form an integrated whole. Organized as follows: individual preference and individual choice; individual preference and social choice; basic theory of noncooperative games; elections and two-person zero-sum games; non-zero-sum games (political economy, public goods, and the prisoners' dilemma); institutions, strategic voting, and agendas; cooperative games and the characteristic function, the core; solution theory; and research frontiers related to repeated games and information. Ordeshook is at the University of Texas, Austin. Index.

REISMAN, DAVID. *The economics of Alfred Marshall*. Foreword by G. L. S. SHACKLE. New York: St. Martin's Press, 1986. Pp. ix, 433. \$32.50. ISBN 0-312-23430-9.

JEL 87-0370

Examines Marshall's theories and evaluates them, explaining his contributions. Pays particular

attention to assumptions, constraints, tentative conclusions, and distinctions that are not always clearly set forth by Marshall. Concerned with the heart of Marshall's analyses such as: demand, including the demand curve and its antecedents, the income effect, and consumption, supply, emphasizing the supply curve, cost and time, and normal values and representative firms, the internal and external economies of size; the diseconomies of size and the effect of time periods; market structures, focusing on perfect and monopolistic competition and monopoly and oligopoly, distribution, land, including its supply and rents and costs, the demand and supply of labor and the influence of trade unions; the demand and supply of capital and human capital, and organization, describing its nature and the supply of organizational ability. Reisman is a Senior Lecturer in Economics at the University of Surrey. Index.

SAMUELSON, PAUL. *The collected scientific papers of Paul A. Samuelson*. Volume V. Edited by KATE CROWLEY. Cambridge, Mass., and London: MIT Press, 1986. Pp. xii, 1052. \$65.00. ISBN 0-262-19251-9.

JEL 87-0371

Contains ninety six articles, all of Paul Samuelson's scientific contributions from 1977 to 1985, as well as papers of a biographical nature and on current topics. Papers are grouped into eight parts as follows: economic theory.

Keynes, and Schumpeter; theories of Marx, Keynes, and others; international trade theory (two papers); international economic theory (seven papers); biographical and other papers (ten papers); and other papers (twenty papers). Some of the original articles contain a few typographical and mechanical errors. Crowley was coeditor of the fourth volume. Index.

SCHÄFFER, MARTIN. *Resource extraction and market structure*. Lecture Notes in Economics and Mathematical Systems series, vol. 263. Berlin, New York and Tokyo: Springer, 1986. Pp. ix, 154. \$17.50, paper. ISBN 3-540-16081-7.

JEL 87-0372

Develops a microeconomic oligopoly model of resource extraction. Surveys models using monopolistic or pure competitive market structure, analyzes models that consider uncertainty about the size of the resource stock, future technologies, and the cost of developing a substitute for the resource, introduces basic results of the theory of differential games, and discusses models of duopolistic markets of an exhaustible resource. Proceeds to develop an oligopoly model of a resource market as given

by a differential game of more than two players and compares the results from previous chapters to derive explicit implications for prices, quantities, and the market structure. Computes characteristic examples using the model and finds that the extraction behavior of oligopolists depends on the cost structure, time horizon, and initial resource endowments. The general conclusion is that the market equalizes the oligopolists, i.e., their policies converge. Schäfer is at the Universität der Bundeswehr Hamburg, West Germany. Bibliography; no index.

STIGLER, GEORGE J. *The essence of Stigler*. Edited by KURT R. LEUBE and THOMAS GALE MOORE. Foreword by W. GLENN CAMPBELL. Stanford, Calif.: Stanford University, Hoover Institution Press, 1986. Pp. xxviii, 377. \$35.95. ISBN 0-8179-8461-5. JEL 87-0373

Published in honor of George Stigler's 75th birthday, this volume contains twenty-three essays, selected from Stigler's writings. The first part deals with Stigler's contributions to economics, with five essays concerned with the economics of minimum wage legislation, the division of labor, economics of scale, economics of information, and theories of economic regulation. The second part treats contributions to political economics, covering the intellectual and the marketplace, goals of economic policy, the economist and the state, economic and political competition, and the processes and progress of economics. Five additional selections make up the third part—contributions to industrial organization—covering a theory of oligopoly, the dominant firm and the inverted umbrella, economic effects of antitrust laws, the case of electricity as a study of what can regulators regulate, and the theory of regulation. Part 4 includes four contributions to the history of economic thought, such as a historical view of perfect competition, the theory of Fabian socialism, economics or ethics, and why the socialists have been winning. The last part with four essays represents the "wit" of Stigler. It covers the cost of model changes, John Kenneth Galbraith, demand and supply elasticities, and the history of truth in teaching. Leube is a visiting scholar at the Hoover Institution. Moore is a Senior Fellow at the Hoover Institution. Index.

STIGLER, GEORGE J. *The theory of price*. Fourth edition. New York: Macmillan; London: Collier Macmillan, [1942 . . . 1966] 1987. Pp. viii, 369. \$26.50. ISBN 0-02-417400-9. JEL 87-0374

Revised edition of an introductory textbook on the essentials of the theory of the allocation of resources and the determination of prices. Much of the book has been rewritten; main additions are

chapters on the economics of information and on the economic role of the state. Brief portraits of twenty major economists have been added. Specific topics include: prices and the enterprise economy, the theory of utility; pricing with limited supplies, supplies of productive services; costs and production, diminishing returns; returns to scale, the general theory of competitive prices, the theory of monopoly; oligopoly, cartels, and mergers, demand for productive services; rents and quasi-rents; wage theory, the size distribution of income, and capital and interest. Chapters conclude with lists of recommended readings and problems. Stigler is at the University of Chicago. Index.

[TARSHIS, LORIE] *International monetary problems and supply-side economics: Essays in honour of Lorie Tarshis*. Edited by JON S. COHEN and G. C. HARCOURT. New York, St. Martin's Press, 1986. Pp. viii, 162. \$27.50. ISBN 0-312-42293-8. JEL 87-0375

Seven essays in honor of Lorie Tarshis, a Keynesian economist, presently Chair of the Economics Department of Glendon College, York University, Toronto. Paul Wells wonders why Keynes felt that he had such a struggle to escape from old ideas when "he excelled at inventing new ones." Also examines how Keynes would cope with overvalued exchange rates. Ronald I. McKinnon discusses the role of foreign-exchange dealers, pointing out that the foreign-exchange market cannot be treated as if it were a market for ordinary flexibly priced commodities. Susan Howson and D. E. Moggridge contribute two essays dealing with the international monetary system. They address problems such as the operation, reform, and influences on domestic policies of the international system and the ramifications of the mobility of international short-term capital. Walter S. Salant discusses the claims of supply-side economics that it increases employment and reduces inflation and the international aspects of these claims. Tibor Scitovsky examines the U.S. personal saving rate. Michael M. Weinstein describes lessons that can be learned from the experiences of the 1930s with industrial planning and economic policy making. Cohen is Professor of Economics at the University of Toronto. Harcourt is University Lecturer in Economics and Politics at Cambridge University. Index.

### 030 HISTORY OF ECONOMIC THOUGHT; METHODOLOGY

FOLEY, DUNCAN K. *Understanding capital: Marx's economic theory*. Cambridge, Mass., and Lon-

don: Harvard University Press, 1986. Pp. viii, 183. \$20.00, cloth; \$8.50, paper. ISBN 0-674-92088-0, pbk. JEL 87-0376

Introduction to Karl Marx's economic theory as well as a guide to fundamental passages in Marx's writings on economics and to the overall structure of Marx's economic ideas. Specific topics include: labor, value, and money; the theory of capital and surplus value; production under capitalism; reproduction of capital; equalization of the rate of profit; division of surplus value; the falling rate of profit; the theory of capitalist crisis; and socialism. Foley is Professor of Economics, Barnard College, Columbia University. Index.

PROSCH, HARRY. *Michael Polanyi: A critical exposition*. SUNY Series in Cultural Perspectives. Albany: State University of New York Press, 1986. Pp. x, 354. \$44.50, cloth; \$14.95, paper. ISBN 0-88706-277-6. JEL 87-0377

A review of the contributions of Michael Polanyi—a physician, chemist, philosopher, and economist. Divided into four parts—following the physician approach—namely, diagnosis, prescription, treatment, and evaluation. Restates Polanyi's position in each part, together with the reasons for holding that position. Describes the indications of malaise in the modern mind and its causes, discusses Polanyi's approach to a study of the validity of science and knowledge, followed by an integration of Polanyi's ideas about generalizations, discovery, and verification. Describes Polanyi's case for the existence of "ontological hierarchies" and the meaningfulness of human achievement and the significance of human life. In the evaluation, the author touches on a variety of areas, including an analysis of diversities and dualism in Polanyi's writings. Prosch is at Skidmore College. Index.

STANFIELD, J. R. *The economic thought of Karl Polanyi. Lives and livelihood*. New York: St. Martin's Press, 1986. Pp. x, 162. \$25.00. ISBN 0-312-23658-1. JEL 87-0378

Intent is "to draw attention to the possibility and necessity of an economics that is more existential and human-centered than the conventional economics." Considers the work of Karl Polanyi as "an excellent start toward a new way of thinking about the economy and its place in society, of lives and livelihood." Credits Polanyi with arguing that beyond sufficient livelihood, preoccupation with more economic wealth "greatly erodes the quality of human existence." Reviews the life of Polanyi and presents a summary of his works and contributions, describing his socialism; his founding of *Co-Existence*, an interdisciplinary journal for the comparative study of economics; his concerns for val-

ues, ethics, and meanings in economic activity, and his contributions to anthropology. Discusses Polanyi's work on the methodology of economics, particularly general problems of methodology and historical problem of political economy, and his contributions to social and economic integration, the political economy of market capitalism, and industrialism and freedom. Stanfield is Professor of Economics at Colorado State University, Fort Collins. Index.

ZAREMBKA, PAUL. *Research in political economy*. Volume 9. A Research Annual. Greenwich, Conn., and London: JAI Press, 1986. Pp. vii, 252. ISBN 0-89232-661-1. JEL 87-0379

Eight papers discuss aspects of political economy in the Marxian tradition. They consider, the various definitions, usages, and conceptualizations of class in the literature of social analysis (Richard Wolff and Stephen Resnick), racial distribution of income, centering on an empirical analysis of the determinants of the incomes of white South Africans (Fred Curtis), a "noneconomistic" reading of the Marxian theory of value (Antonio Callari), a Marxian framework for the analysis of wage determination using a case study of the Sudanese agricultural labor markets (Abbas Abdelkarim), the micro-macro dialectic as a basis for a Marxian microfoundation (Jonathan P. Goldstein), implications of the Yugoslav model for Marx's vision of socialism and vice versa (John E. Elliott and Joanna V. Scott), similarities between China and the Soviet Union (Park) and the social theories of socialist planning theory (Factors are mainly at State University of

#### 040 ECONOMIC HISTORY

CAIRNCROSS, ALIC. *The price of war. British policy on German reparations, 1941-1949*. Oxford and New York: Blackwell, 1986. Pp. x, 249. \$34.95. ISBN 0-631-14919-8. JEL 87-0380

An account of German reparations after World War II up to 1949, by one who took part in those negotiations. Begins with a historical review of the concept of reparations, citing four problems from the past—the transfer problem in assessing a country's ability to pay, the form of payment, the source of reparations funds, and the effects on popular opinion. Early and later wartime views are described, pointing out that the treatment of Germany was the subject of elaborate discussion in Britain long before peace was in sight. Details the

work of the Malkin Committee and traces discussions and developments from Yalta to Potsdam and to the final reparations plan. Discusses the latter in detail, noting its intent to institute a series of structural adjustments. Also discusses events after the plan, the fading out of reparations, and Soviet reparations from East Germany. Conclusions point to the difficulties faced among the four Western nations over administering reparations, especially the form of payment. Notes also that the ability to make any reparations payments is affected by the status of the international economy. Sir Alec Cairncross is Chancellor of Glasgow University. Bibliography; index.

CHAO, KANG. *Man and land in Chinese history: An economic analysis*. Stanford, Calif.: Stanford University Press, 1986. Pp. xii, 268. \$35.00. ISBN 0-8047-1271-9. JEL 87-0381

Posits that China was a market economy for more than two millennia before the 1950s and that its varying degrees of development and changing levels of technology reflect adjustments in economic choices by the Chinese people as a response to an increasing man-land ratio caused by the increase in population. Constructs a model and examines statistics of population and arable acreage and other data to analyze the economic consequences of this response. Examines the measurement of population and arable land, land fragmentation and distribution, the evolution of tenure systems, and agricultural technology in traditional China. A general conclusion is that an industrial revolution did not occur in China despite existing technology and skill because there was no demand for labor-saving devices; rather, the main problem was how to gainfully use an oversupply of available labor. Chao is Professor of Economics, University of Wisconsin, Madison. Index.

[COLEMAN, D. C.] *Business life and public policy: Essays in honour of D. C. Coleman*. Edited by NEIL MCKENDRICK AND R. B. OUTHWAITE. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xiv, 263. \$44.50. ISBN 0-521-26275-5. JEL 87-0382

Eleven original essays pay tribute to Donald Coleman, Emeritus Professor of Economic History at the University of Cambridge, upon his retirement. Two themes are reflected in the essays: the operations and business values of businessmen in history and the factors that have shaped and influenced government policies. Topics covered by the contributors include: Piscatorial politics in the early Parliaments of Elizabeth I; marriage as business—early modern England; age and accumulation in the London business community—

1665–1720; the use and abuse of credit in early eighteenth century England; the forces behind the early settlement of Australia; the gentlemanly, business, and professional ideals in English literary culture; two pioneers in invisible exports—the Phoenix Fire Office and the Royal of Liverpool, 1800–90; the engineer in Victorian society; Bernard Shaw, Bertold Brecht, and the businessman in literature; British business and businessmen during the First World War; and the nationalization of coal, 1916–46. The contributors are mainly historians. McKendrick and Outhwaite both are Fellows of Caus College and University Lecturers in History, University of Cambridge. Index.

FRERIS, A. F. *The Greek economy in the twentieth century*. New York. St. Martin's Press, 1986. Pp. 226. \$29.95. ISBN 0-312-34724-3. JEL 87-0383

Examines Greece's economic history from the 1920s to the 1980s against the background of general economic and political developments. Begins with a discussion of the Asia Minor disaster (1920s), monetary problems, and the foundation of the Bank of Greece. Covers the decade of economic depression (1930s), the financial crisis and default, and developments in industry and agriculture, World War II, occupation and its aftermath; reconstruction and development during the period 1949–60; the absence of conditions for self-sustaining growth in the 1960s and 1970s, and the costs and benefits of Greece's accession to the EEC in 1981. A general conclusion is that a major reason that Greece's economic performance lags behind other European countries is that chances for industrialization were missed in the 1950s because of the absence of extensive state participation in reconstruction and development. Freris is Principal Lecturer in Economics, Department of Business and Management, City Polytechnic of Hong Kong. Bibliography; index.

HUDSON, PAT. *The genesis of industrial capital: A study of the West Riding wool textile industry c. 1750–1850*. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xviii, 345. ISBN 0-521-25671-2. JEL 87-0384

Presents a study of a regional industrial sector during a period of marked change, focusing on finance, particularly the accumulation and "... polarization of wealth, a vital process in the growth of centralized, mechanized production." Provides insights into the emergence of industrial capitalism on a broader front, though focusing on the development of factory industry in Yorkshire. Finds parallels with the growth and finance of other consumer goods industries during the prefactory period. Be-

gins with a general historical analysis of capital accumulation, emphasizing its importance in the dynamics of economic growth. Criticizes economic analysis from the late nineteenth century until the 1950s for its emphasis on output and price at the expense of growth and finance. Discusses the debate about the relationships among capital accumulation, growth, and cheap labor. Reviews the sources of finance for early British industrialization. Examines specifically the West Riding wool textile sector, 1750–1850, to support generalizations about capital accumulation—the processes of capital accumulation, the importance of merchants in the building of factories, the role of landlords, the role of local banking, and the importance of reinvested earnings. Based on the author's Ph.D. Dissertation at the University of York (1981). Hudson is a Lecturer in the Department of Economic History, University of Liverpool. Bibliography, name, place, and subject indexes.

HUGHES, JONATHAN. *American economic history*. Second edition. Glenview, Ill., and London: Scott, Foresman, [1983] 1987. Pp. 604. \$32.95. ISBN 0-673-18350-5. JEL 87-0385

Second edition of an introductory textbook of American economic history. Contains new chapters on the post-World War II manufacturing industry describing the technological and market stagnation of the American steel and auto industries, updated tables, and the inclusion of improved data and material from books and journals published since 1982. [For annotation of the previous edition, see JEL no. 83-0617.] Sections contain introductory essays and lists of suggested readings. Hughes is at Northwestern University. Glossary, name and subject indexes.

NEUSCHATZ, MICHAEL. *The golden sword: The coming of capitalism to the Colorado mining frontier*. Contributions in American Studies series, no. 84. New York and London: Greenwood Press, 1986. Pp. xii, 301. \$37.95. ISBN 0-313-25104-5. JEL 87-0386

Focuses on the struggle between the Western Federation of Miners and the Colorado gold and silver mineowners at the turn of the century. Points out that the weapons of trade unions have changed to match the changing contours of the institutional "battlefield," especially since earlier activities were unprotected by legislation providing for the right of collective bargaining. Traces how the Western Federation went through phases from a militant economic approach, to a radical political one, and back to a bread-and-butter philosophy. Covers topics such as the environmental setting, the unionization of Colorado labor, the effects of the technical

revolution in mining, developments in labor relations, the roles of both labor and the owners, and the various strikes and their aftermath. Contends that theories of labor relations based primarily on the character of leadership are insufficient to explain the behavior of labor unions. Neuschatz specializes in the social impact of economic development and the history of the labor movement. Bibliography, index.

PARKER, WILLIAM N., ed. *Economic history and the modern economist*. Oxford and New York: Blackwell, 1986. Pp. xi, 105. \$17.95. ISBN 0-631-14799-3. JEL 87-0387

Five papers, four previously published, and five commentaries, most presented at the American Economic Association meetings in Dallas in December 1984. William N. Parker reviews the development of economics. Kenneth J. Arrow considers the interaction of economic theory and history, and Robert E. Solow argues for greater emphasis on economic history. Paul A. David and Peter Temin present case studies of computer terminals and telephone separations, respectively, to illustrate the interaction between economic theory and economic history. Comments by Donald N. McCloskey, W. W. Rostow, Gavin Wright, Charles P. Kindleberger, and William N. Parker discuss the relevance of history to past and future developments in economic theory. Parker is Professor of Economics.

SCHAPIRO, MORDECAI. *Economic-demographic growth and distribution in the United States: The Social Fabric*. Ann Arbor: Monographs, vol. 1. Ann Arbor: JAI Press, 1986. Pp. xiv, 301. ISBN 0-89232-675-1. JEL 87-0388

Study examining factors that contributed to the settlement of the rural north of the United States. Examines the pattern of rural population growth in twenty-three states in this region during the period 1790 to 1900. Finds a basic pattern of population buildup as follows: initially, very low rates of population increase but, eventually sustained rapid growth, to be followed by a slowing growth rate and then a stable population. Presents an analysis of fertility, using both theoretical and empirical models. Also discusses the theory of migration, using a gravity-type model based on 1950 census data. Combines a fertility model and a migration model into a settlement model and produces a control solution, contrasts its estimates with three scenarios—no European immigration, no rural-to-urban migration, and no decline in rural fertility.

Concludes that a probable explanation for the decline in birth rates was a decrease in the demand for children, which was associated with a growing scarcity of land. Also discusses implications for developing nations. Schapiro is a member of the Department of Economics at Williams College. Bibliography; index.

SHANIN, TEODOR. *Russia as a 'developing society.' The Roots of Otherness. Russia's Turn of Century.* Volume 1. New Haven and London: Yale University Press, 1986. Pp. xvi, 268. \$30.00, cloth; \$9.95, paper. ISBN 0-300-03660-4, pbk.

JEL 87-0389

First of a two volume study that looks at Russian society at the turn of the nineteenth century, attempting to untangle the different, yet related, themes of Russian history on its way to the revolutionary periods of 1905-07 and 1917-21. Chooses the Russian state, peasantry, and capitalism—the main power structure and way of living—as factors in Russian social determination. Focuses on the peasant economy and the general picture of Russia in a state of flux during this developmental period. Examines the morphology of Russian "backwardness" and the rhythms of Russian history that led to the revolutions "from below" and the transformations "from above," relating these events to "what we have learned since about the so-called 'developing societies.'" Presents basic information about Russia, such as the early historical origins of the contemporary Russian state, the formation of the empire, the organization of the peasant society, and the development of capitalism in Russia. Also examines major points of debate as they describe the peasant economy, the rural proletariat, the agrarian markets, the peasant economy modes of production, Russia's political economy, the sociopolitical structure, and the historical roots of the ideological and political dissent at the turn of the nineteenth century. Shanin is at the University of Manchester. Names and subject indexes.

SHANIN, TEODOR. *Russia, 1905-07: Revolution as a moment of truth. The Roots of Otherness: Russia's Turn of Century.* Volume 2. New Haven and London: Yale University Press, 1986. Pp. xvi, 379. \$30.00, cloth; \$9.95, paper. ISBN 0-300-03661-0, pbk.

JEL 87-0390

An analysis of the Russian revolution of 1905-07. Begins with the build-up of the major forces of the revolution—the struggle in the cities for political freedom and/or socialism and the struggle in the villages for land and liberty. Examines the social forces that came together in 1905-07, the surprise of the contemporaries who watched the revolution unfold, and the international ramifica-

tions of it. Describes the revolutionary forces, emphasizing the struggle for democratization and the battle for land and liberty. Examines the power and weaknesses of Russian state, the ethnic problems, and the urban class differences and confrontations. Details the peasant war of 1905-07, focusing on its contemporaries and the postrevolutionaries. Finally, discusses the lessons learned from this experience and the significance for the 1917-21 revolution. Shanin is at the University of Manchester. Name and subject indexes.

## 050 ECONOMIC SYSTEMS

FAGEN, RICHARD R.; DEERE, CARMEN DIANA AND CORAGGIO, JOSÉ LUIS, eds. *Transition and development: Problems of third world socialism.* M/R Censa Series on the Americas. New York: Monthly Review Press and Center for the Study of the Americas, Berkeley, 1986. Pp. 352. \$28.50, cloth; \$12.00, paper. ISBN 0-85345-705-0, pbk.

JEL 87-0391

Thirteen papers presented at two seminars regarding the problems of transition to socialism in small economies held in Washington, D.C., in October 1983 and Managua, Nicaragua, in September 1984. Two papers reject autarky as a development strategy for small, peripheral third world economies and one examines problems of agrarian reform, peasant and rural production, and the organization of production in the transition to socialism. Two papers reflect on the economic and political aspects of the Nicaraguan experience. One paper discusses U.S. imperialism, one examines the theoretical view of the role of the state, while two cover the role of ideology in the transition to socialism. Four papers analyze the politics of transition and cover issues of mass mobilization, organization, and participation. Also contains an introductory overview by the editors. The contributors are mainly social scientists. Fagen is Gildred Professor of Latin American Studies at Stanford University. Deere is Associate Professor of Economics at the University of Massachusetts at Amherst. Coraggio is Research Director at the Regional Coordinator of Socio-Economic Research (CRIES) in Managua. Bibliography; index.

KNOWLTON, WINTHROP AND ZECKHAUSER, RICHARD, eds. *American society: Public and private responsibilities.* Cambridge, Mass.: Harper and Row, Ballinger, 1986. Pp. x, 344. \$24.95. ISBN 0-88730-129-0.

JEL 87-0392

Thirteen papers presented at a symposium on the roles of government and the private sector at

Harvard University in March 1986. Part 1 outlines the historical factors that have shaped American attitudes toward the role of public authority. Part 2 reviews the causes for the present distribution of function and authority between government and the private sector and prescribes its reallocation among four kinds of institutional arrangements. Part 3 is devoted to an examination of the roles of government and the private sector toward environmental management, public policy toward cigarette smoking, the struggle against poverty, support of the arts, education, and science. Part 4 deals with the role of the corporation in the economy and the impact of government policy on economic performance. The contributors are mainly social scientists and public policy specialists. Knowlton is Henry R. Luce Professor of Ethics, Business and Public Policy and Zeckhauser is Professor of Political Economy, both at the John F. Kennedy School of Government, Harvard University. Index.

MOFFAT, ROBERT E. *Money and wealth in the affluent society: Some practical realities*. New York: Vantage Press, 1983. Pp. x, 195. \$13.25. ISBN 533-05607-1. JEL 87-0393

Appraises some issues related to money and wealth in Western society today. Proposes that the distinction between government-owned enterprise and privately owned enterprise has become meaningless for many purposes, and that a more useful approach is to examine "economic institutions" that support themselves from the proceeds of saleable products as contrasted with those that get financial resources from somewhere else. Also argues that recent price increases and inflation cannot be explained in terms of any cause, but must be looked at in terms of a weakening of the social and business reasons for resisting higher prices. Topics include: individual incentives for business, groups organized for business purposes, personal sources of money to spend, inflation, prices, factors tending to expand and reduce available purchasing power, willingness to spend, interest, and production. A general observation is that modern Western society is moving rapidly toward government control but is pretending it is moving toward private enterprise. Moffat is an economist and lawyer living in Canada. No index.

PRYOR, FREDERIC L. *A guidebook to the comparative study of economic systems*. Englewood Cliffs, N.J.: Prentice-Hall, 1985. Pp. x, 342. Paper. ISBN 0-13-368853-4. JEL 87-0394

Introduction to the field of economic systems, emphasizing empirical comparisons, particularly of East and West Europe. Explores two basic ques-

tions—the impact of an economic system or institution and the forces underlying the development and decline of particular institutions. Discusses topics such as goals, performance criteria, and policy instruments, economic growth and dynamic efficiency, economic stability, static efficiency and the allocation of productive resources, from both the nonprice and pricing mechanism perspectives, consumption and trade, factor allocation and the distribution of income, and economics of property relations. Most chapters contain summaries and suggested reading lists. Pryor is at Swarthmore College. Index.

## 100 Economic Growth; Development; Planning; Fluctuations

### 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

COLMAN, DAVID AND NIXSON, FREDERICK. *Economics of change in less developed countries*. Second edition. Oxford, England: Allan, Totowa, N.J.: Barnes and Noble, [1978] 1986. Pp. ix, 445. \$31.50, cloth \$19.75, paper. ISBN 0-489-20570-5, pbk

Second edition covers ports, and empire been rewritten. Re material on inflation in tized countries, an of dependency, the and human resou 79-0372 for annota and Nixon are both ter. Author and subject index.

COMMONWEALTH SECRETARIAT. *Vulnerability: Small states in the global society. Report of a Commonwealth Consultative Group*. London: Author, 1985. Pp. vii, 126. £ 5.00, paper. ISBN 0-85092-280-1. JEL 87-0396

Report on the special economic problems of small nation states examines the characteristics and geographic setting of small commonwealth states and the nature of their vulnerability to threats to territorial, political, and economic security. Outlines strategies for reducing vulnerability through strengthening defense capability, improving prospects for economic growth, promoting internal cohesion, managing diplomacy and foreign policy, and measures undertaken under the aegis of inter-

national organizations. Identifies arenas for action and outlines policy measures at the national, regional and global level. No index.

DEGER, SAADET. *Military expenditure in third world countries: The economic effects*. International Library of Economics series. London; Boston and Henley, England: Routledge and Kegan Paul, 1986. Pp. xv, 288. \$34.50. ISBN 0-7102-0304-7.

JEL 87-0397

Analysis of the economic impact of military expenditure in third world countries. Discusses the ambiguity regarding the relationship between defense expenditure and economic growth and development and the nature of militarization and militarism. Summarizes problems and issues relating to data on military expenditure. Analyzes military expenditure within the government budgetary process and the short-term allocation effects of government revenue constraints. Examines the impact of military spending on saving, investment, and human capital formation. Reviews the military burden in an open economy and the role of arms production in newly industrializing countries. Assesses the role of defense spending on economic growth and socioeconomic development. Case studies supplement analytical material. Deger is an Economic and Social Science Research Council Fellow at Birkbeck College, University of London. Name and subject indexes.

HILL, POLLY. *Development economics on trial: The anthropological case for a prosecution*. Cambridge; New York and Sydney: Cambridge University Press, 1986. Pp. xiii, 198. \$34.50, cloth; \$10.95, paper. ISBN 0-521-31096-2, pbk.

JEL 87-0398

An economic anthropologist's critique of the stereotyped and overgeneralized premises of conventional development economics. Early chapters castigate economists for their treatment of all country people as peasants and their disregard of economic inequality, the poor quality of official statistics, and of historicist fallacies in a vain search for universal generalization. The rest of the book offers insights into economic inequality within rural communities; the poverty of statistics related to farming households; village credit systems; inheritance systems; farm laboring systems; migration; the role of women; the significance of land selling; and rural class stratification. Hill is a Fellow of Clare Hall, Cambridge University. Glossary; index.

[HIRSCHMAN, ALBERT O.] *Development, democracy, and the art of trespassing: Essays in honor of Albert O. Hirschman*. Edited by ALEJANDRO FOXLEY.

MICHAEL S. MCPHERSON, AND GUILLERMO O'DONNELL. Notre Dame, Ind.: University of Notre Dame Press for the Helen Kellogg Institute for International Studies, 1986. Pp. vii, 379. \$25.95. ISBN 0-268-00859-0.

JEL 87-0399

Nineteen essays originally presented at a conference at the University of Notre Dame in April 1984 in honor of Albert O. Hirschman. They consider the interplay of the political, economic, and social factors in society and reflect the theories and concepts of Hirschman, especially those pertaining to the formulation of a constructive approach for the reconciliation of development and democratic aspirations and the problems of the Latin American economy. Some specific topics are: linkages in the industrial development of petrochemicals in Brazil, the economics of fascism and nazism, American banking and the world financial crisis, the balance between stimulation and constraint in analysis of development, strategies for change and social learning processes, dismantling repressive systems, collective protest, the social scientist as constructive skeptic, the methodological basis of Hirschman's development economics, and critique of rational choice theories. The contributors include economists and other social scientists. Foxley holds the Helen Kellogg Institute Chair of International Development and is Professor of Economics, University of Notre Dame. McPherson is Professor of Economics, Williams College and Senior Fellow, Brookings Institution. O'Donnell is Academic Director, Kellogg Institute and Professor of Government and Sociology, University of Notre Dame. No index.

LOONEY, ROBERT E. *The political economy of Latin American defense expenditures: Case studies of Venezuela and Argentina*. Lexington, Mass., and Toronto: Heath, Lexington Books, 1986. Pp. xxii, 325. \$39.00. ISBN 0-669-12928-3.

JEL 87-0400

Analysis of the determinants and impact of Latin American defense expenditures. Part 1 determines the appropriateness of economic variables for examination of defense issues. Cross sectional analysis is conducted to determine the economic environment conducive for arms production, the impact of defense spending and arms production on economic growth, the budgetary process, and the defense and socioeconomic budgetary tradeoffs in Latin America. Parts 2 and 3 present detailed analysis of the patterns, determinants, budgetary tradeoffs, and future trends in defense expenditures, in Venezuela and Argentina, respectively. Looney is Professor of National Security Affairs at the Naval Postgraduate School, Monterey. Bibliography; index.

LUTTRELL, WILLIAM L. *Post-capitalist industrialization: Planning economic independence in Tanzania*. New York and London: Greenwood Press, Praeger, 1986. Pp. xv, 189. \$42.95. ISBN 0-275-92310-X. JEL 87-0401

Presents an approach to development planning and strategy that was debated in Tanzania during the early 1970s but has not yet been implemented. Proposes to base development planning within the framework of an industrialization strategy specifically tailored to the needs and resources of the people in the affected country, without compromising the commitment to a complete, rapid, and self-reliant industrial revolution. Begins by sketching why the author believes that China and North Korea were the only colonies after World War II that were able to carry out a thorough industrialization of their economies. Discusses the failures of Cuba and Algeria to industrialize. Reviews the theory upon which planning methods are based and describes these methods. Using this analysis, presents a plan for the development of an integrated iron and steel industry for Tanzania, based on data for the economy for the years 1960-71. Criticizes planners for emphasizing agriculture and light industry resulting on imports for semifinished goods, plant, and equipment. Presents two perceived obstacles to industrialization—the political objections of international agencies and foreign-exchange costs. Luttrell is a Senior Economist with GATT-Fly, in Canada, an international project dealing with global economic development. Bibliography, index.

MIKESSELL, RAYMOND F. *Stockpiling strategic materials: An evaluation of the national program*. AEI Studies series, no. 431. Washington, D. C.: American Enterprise Institute for Public Policy Research, 1986. Pp. ix, 68. Paper. ISBN 0-8447-3588-4. JEL 87-0402

Integrates and evaluates the existing literature dealing with the National Defense Stockpile (NDS) programs as a basis for determining national policy, reviewing the history of the program and evaluating criticisms and proposals for legislative and administrative changes. The introduction describes strategic and critical materials, presenting data both on goals and current inventory. Presents a legislative and administrative history of the program, followed by a discussion of the national defense stockpile and its organization, policies, and programs. Reviews the major criticisms of the NDS program and discusses proposals for change and alternative solutions. Concludes that the objectives of the program are too limited in view of the present international environment and the defense responsibilities of the United States. Mikesell is a

Professor of Economics at the University of Oregon. No index.

SAU, RANJIT. *Economy, class, society*. Madras: Universities Press, distributed by Orient Longman, Hyderabad, India, 1986. Pp. xiv, 294. Rs 55.00, paper. ISBN 0-86131-426-X. JEL 87-0403

Ten essays, based on the author's lectures and published articles from 1981 to 1984, consider three interrelated themes: the methodology of political economy, the political economy of an underdeveloped country like India, and the international aspects of development and underdevelopment. Also reflects upon the present economic crisis in the world economy, the crisis in economic theory, and development strategy. Essays discuss: the methodology of political economy; the political economy of India; growth, stagnation, and fluctuation in the Indian economy; the role of the middle class in the underdeveloped country; world economic crisis and economic theory; international aspects of economic development; international division, subdivision, and fragmentation of labor; Africa's options in development strategy; the dialectical method in economics; and the development of capitalism in India. Sau is Professor of Economics, Indian Institute of Management, Calcutta. Bibliography, index.

87-1611, 87-1612, 87-1613, 87-1614, 87-1615, 87-1616, 87-1617, 87-1618, 87-1619, 87-1620, 87-1621, 87-1622, 87-1623, 87-1624, 87-1625, 87-1626, 87-1627, 87-1628, 87-1629, 87-1630, 87-1631, 87-1632, 87-1633, 87-1634, 87-1635, 87-1636, 87-1637, 87-1638, 87-1639, 87-1640, 87-1641, 87-1642, 87-1643, 87-1644,

Discusses financing economic growth and the role of the state and state enterprise and analyzes market prospects for exports in industrial country markets. Coauthors are Gerardo M. Bueno, Pedro Pablo Kuczynski, and Mario Henrique Simonsen. Balassa is a Visiting Fellow, Institute for International Economics, Washington, D.C. Index.

BARRALDOS, JOHN P. *A key to the Canadian economy*. Lanham, Md., and London: University Press of America, 1986. Pp. x, 407. \$34.50, cloth. \$18.75, paper. ISBN 0-8191-5421-0, pbk.

JEL 87-0405

An introduction to the Canadian economy aimed at the general reader, economist, or student. Discusses money, banking, and monetary policy, the nature of Canada's fiscal system, Keynesian economics, and Canadian fiscal stabilization policy. Provides the background to, and discusses issues in, debt management. Analyzes the theory of inflation, the nature of inflation and past attempts at wage-price controls. Presents the background to international trade and discusses the process of the formulation of economic policy, the impact of the breakdown of the international fixed-exchange-rate system, and Canadian foreign-exchange, balance-of-payments, and foreign-investment policies. Barardos is an economic advisor to the Canada Post Corporation. No index.

BURKI, SHAHID JAVED. *Pakistan: A nation in the making*. Boulder, Colo., and London: Westview Press, Karachi: Oxford University Press, 1986. Pp. xiii, 226. \$28.00. ISBN 0-86531-353-9.

JEL 87-0406

Traces the history of Pakistan as an independent state from 1947 to the present. Examines its origins as a state created for the Muslims of British India with malleable frontiers, how it became divided into East and West Pakistan, and then in 1971 into Pakistan and Bangladesh. Overviews its political instability under various political systems over the years. Discusses the many different economic strategies Pakistan has tried since 1947, the problems the economy currently faces, its potential, and the policies of the Sixth Five-Year Plan (1983-88). Also discusses national social development and looks at foreign relations with India, Afghanistan, the United States, Third World, and Muslim World. Also considers Pakistan's possible development of a nuclear capability. Burki is Director, International Relations Department, World Bank. Bibliography; index.

GOMES, GUSTAVO MAIA. *The roots of state intervention in the Brazilian economy*. New York and Lon-

don: Greenwood Press, Praeger, 1986. Pp. xvii, 376. \$42.95. ISBN 0-275-92144-1.

JEL 87-0407

Argues that Brazil's history and society can be characterized by class exploitation as revealed by the extremely uneven distribution of income and property ownership. A further argument is that the dominant classes have almost always been able to use the state to maintain and expand their domination as reflected in the character of state policies and perpetuation of class exploitation. Reviews four centuries of economic and social transformation from Brazil's origins to 1930. Examines the industrialization period between 1930 and 1964 and the involvement of the state with the economy. Considers the economic policies implemented by the military regime that emerged from the overthrow of the Goulart government in 1964, i.e., dismantling the labor movement, wage policies, tax reform, and policies favoring the bourgeoisie. Based on the author's Ph. D. dissertation at the University of Illinois (1983). Gomes is a Professor of Economics, Federal University of Pernambuco, Brazil. Bibliography, name and subject indexes.

HARTLYN, JONATHAN AND MORLEY, SAMUEL A., eds. *Latin American political economy. Financial crisis and political change*. Boulder, Colo., and London: Westview Press, 1986. Pp. xiii, 386. \$38.00, cloth. \$16.95, paper. ISBN 0-8133-0329-X

JEL 87-0408

Twelve essays and four commentary papers consider the major historical and contemporary determinants of the development crisis facing Latin America. Many of the papers were first presented at the International Conference on Models of Political and Economic Change in Latin America at Vanderbilt University in November 1983. Four papers provide comparative perspectives, they overview the political regimes and their economic performances; analyze the performance of bureaucratic-authoritarian regimes in Argentina, Chile, and Brazil; compare the adjustments of various countries to the oil shocks of 1973 and 1979; and examine the financial blowups that resulted from the neoliberal policies of the bureaucratic-authoritarian regimes in Argentina, Chile, and Uruguay, and the state-directed policies adopted in Brazil and Mexico. The following eight papers are case studies of Argentina, Brazil, Chile, Peru, Mexico, Colombia, Cuba, and Nicaragua. Hartlyn is Assistant Professor of Political Science and Morley is Professor of Economics, Vanderbilt University. Index.

KOSAI, YUTAKA. *The era of high-speed growth: Notes on the postwar Japanese economy*. Translated by

JACQUELINE KAMINSKI. Tokyo: University of Tokyo Press; distributed by Columbia University Press, N.Y., 1986. Pp. xiv, 223. \$24.50. ISBN 0-86008-341-1. JEL 87-0409

Translated from the original Japanese edition *Kōdo seichō no jidai: Gendai Nihon keizai shi nōto* (1981), which also appeared as a monthly series of articles in the journal, *Keizai semina*, from April 1978 to March 1979 under the title *The Course Taken by the Japanese Economy*. Examines and analyzes the history of the contemporary Japanese economy from 1945 until the early 1980s, contains some statistical updates from the 1981 edition as well as vignettes of cultural and political events of the postwar years. Topics considered include: the reconstruction period (occupation and reform; recovery and inflation; the Dodge Plan and the Korean War and its economic outcome, and the bases for economic growth); the rapid growth period (the technological revolution and its impact, income doubling and trade liberalization; and prosperity since the 1960s); and the changeover (the international monetary and oil crises and decelerating growth). A general conclusion is that the Japanese must risk all in an effort to obtain the raw materials that will secure tomorrow's prosperity for the Japanese economy. Kosai is a Professor at the Tokyo Institute of Technology. Bibliography, index.

LANG, TAN TENG. *Economic debates in Vietnam. Issues and problems in reconstruction and development (1975-84)*. Research Notes and Discussions Paper series, no. 55. Singapore: Institute of Southeast Asian Studies, 1985. Pp. vi, 60. \$9.95, paper. ISBN 9971-902-91-5. JEL 87-0410

Analysis of the problems and dilemmas faced by Vietnam in its attempt to promote reconstruction and development within a socialistic framework. Reviews Vietnam's economic development over the period 1954-74, the impetus during 1975-79 and the resulting economic crisis, the new economic policies instituted in 1979, and shifts and debates in policy implementation during 1980-84. Discusses the current options and prospects faced by the Vietnamese economy. Tan Teng Lang is a Senior Evaluation Officer with the Singapore Economic Development Board. Bibliography, no index.

MADDISON, ANGUS, ed. *Latin America, the Caribbean and the OECD. A dialogue on economic reality and policy options*. Development Centre Seminars series. Paris: Development Centre of the Organisation for Economic Co-operation and Development, 1986. Pp. 166. Paper. ISBN 92-64-12887-5. JEL 87-0411

Eight papers and summaries of discussions resulting from a seminar entitled, "Prospects for Latin America in the World Economy of the Eighties," at the OECD Development Center in Paris in June 1985. The seminar was organized in collaboration with the U.N. Economic Commission for Latin America and the Caribbean (ECLAC) and the Centre d'Etudes Prospectives et d'Informations Internationales (CEPII). Topics of papers are: a comparative analysis of economic performance and policy in Latin America and OECD countries, 1938-85, development and crisis in Latin America between 1950-84, medium-term scenarios for the future of Latin America; Caribbean development and the role of the Caribbean Development and Co-operation Committee of the ECLAC, bases for reactivation and development in Central America, the dynamics of world trade from 1967 to 1983, the Latin American transfer problem in historical perspective, and a possible international solution to the foreign debt problem. Also published in French. The editor is at the University of Groningen, the Netherlands. No index.

MONGIA, J. N., ed. *India's economic development strategies 1951-2000 A.D.* Dordrecht, the Netherlands, and Hingham, Mass.: Kluwer Academic; Reidel, New Delhi: Allied Publishers Private, 1985. Pp. xxxvi, 774. ISBN 90-277-2200-5. JEL 87-0412

Eighteen papers and strategies for and strategies for. The papers discuss strategies for over culture, population, fiscal management, control and price balance of payments, wages and incomes, poverty, rural development, human renewal, urbanization, and public administration and plan implementation. The contributors are mainly economists. Mongia is Economic Advisor to the Ministry of Works and Housing, Government of India. Index.

OLAYIWOLA, PETER O. *Petroleum and structural change in a developing country. The case of Nigeria*. New York and London: Greenwood Press, Praeger, 1987. Pp. xvii, 206. \$39.95. ISBN 0-275-92115-8. JEL 87-0413

Examines the political economy of Nigeria since 1860, focusing on its development since political independence in 1960. Argues that the lack of development in Nigeria, despite the petroleum-revenue stimulated growth of the 1970s, is a result of a structural condition of underdevelopment. Pro-

poses that Nigeria has experienced growth without change and, as a result, has failed to establish the basis for internally directed political and economic development. Presents Nigeria's neoclassical development paradigm as well as ideas of third world development theorists and their structural criticisms of neoclassicism. Discusses development planning and its evolution in Nigeria, Nigeria's drive to independence, Nigeria in the 1960s and 1970s, and its present economic crisis caused by the oil bust. Makes recommendations for achieving economic self-reliance, discusses the lesson provided by the Nigerian petroleum experience for understanding development in the third world, and presents an agenda for a new Nigeria based on decentralization. Olayiwola is a Lecturer, Department of Government and Public Administration, University of Ilorin, Nigeria. Selected bibliography; index.

PATEL, I. G. *Essays in economic policy and economic growth*. New York: St. Martin's Press, 1986. Pp. xii, 261. \$35.00. ISBN 0-312-25940-9.

JEL 87-0414

Sixteen essays selected from the author's conference papers and lectures given between 1963 and 1985. Six address shorter-term management of the economy, including the limits of economic policy, trade and development, the balance-of-payments problem, a policy framework for Indian agriculture, inflation, and economic theory and policy. The following six essays consider aspects of economic growth and social justice: the strategy of Indian planning; social justice and economic development; productivity and economic growth, employment, growth, and basic needs; and poverty and free enterprise in the Jawaharlal Nehru era. The remaining four essays discuss aspects of international economic cooperation, including how to give aid, the economic aid relationship, the current crisis in international cooperation, and the climate and prospects for further international economic cooperation as of 1985. The author is Director, London School of Economics and Political Science. Index.

PERKINS, DWIGHT H. *China: Asia's next economic giant?* Henry M. Jackson Lectures in Modern Chinese Studies series. Seattle and London: University of Washington Press, 1986. Pp. x, 98. \$12.95. ISBN 0-295-96402-2.

JEL 87-0415

Two essays, based on lectures delivered at the University of Washington in October 1985, examine China's future role in the world economic system. One paper considers the role of economic policies, economic systems, and politics in a review of the East Asian development experience. The

second paper discusses the nature of reforms in China since 1977 and examines the prospects and conditions necessary for continued reform to investigate whether China is following the East Asian pattern of development. Perkins is H. H. Burbank Professor of Economics at Harvard University. Index.

PREBISCH, RAÚL. *La crisis del desarrollo argentino: De la frustración al crecimiento vigoroso*. Buenos Aires; Lima; Rio de Janeiro and Barcelona: El Ateneo, 1986. Pp. 195. Paper. ISBN 950-02-6293-2.

JEL 87-0416

Written in the form of a dialogue (in Spanish), this book presents questions concerning the evolution of the Argentine economy during recent years, stressing the importance of structural factors in the economic crisis. Explains how society crises have originated in social changes accompanying the evolution of technology and its contradictions. These changes express themselves in dynamic disequilibria, which affect the domestic economies of both the central and peripheral countries, as well as center-periphery relations. Analyzes external disequilibria criticizing recommendations that encourage trade and financial openness. Discusses center-periphery relations, within the context. Finally, deals with the crisis of conventional economic ideas and outlines policy recommendations. No index.

PRYOR, FREDERIC L. *Revolutionary Grenada: A study in political economy*. New York and London: Praeger, 1986. Pp. xx, 395. \$45.00. ISBN 0-275-92155-7.

JEL 87-0417

Analyzes the economy of Grenada, based on interviews with numerous key decisionmakers and examination of formerly classified government documents. Examines the People's Revolutionary Government of Grenada (PRG), noting its economic successes and failures. Details the development strategy of the island, quest for foreign aid, the foreign trade sector, tourism and agriculture as the leading sectors, other economic sectors, the organization of the system, macroeconomic performance, and a discussion of socialist organization in Grenada. Concludes that the succeeding governments will reap the benefits of the protoindustrialization efforts of the PRG and the advantages of the international airport. Approximately 150 pages of appendices present detailed research notes, statistical notes, and a discussion of U.S. foreign policy toward Grenada. Pryor is a Professor of Economics at Swarthmore college. Bibliography, index.

RAMOS, JOSEPH. *Neoconservative economics in the Southern Cone of Latin America, 1973-1983*. Johns

Hopkins Studies in Development series. Baltimore and London: Johns Hopkins University Press, 1986. Pp. xviii, 200. \$25.00. ISBN 0-8018-3040-0. JEL 87-0418

Compares the recent stabilization and liberalization experiences in Chile, Uruguay, and Argentina for the purpose of extracting lessons for the future. Explains the origins of neoconservative thinking in the Southern Cone and describes its theoretical postulates, basic diagnosis, and fundamental policy views. Describes the experiences of each country and evaluates them on the basis of principal results. Analyzes and evaluates the effectiveness of policies in the areas of price stabilization and adjustment, trade, and finance. Recognizes the validity of much of the neoconservative critique of the excessive government interventionism of the past, but finds that the main reason for the failure of the neoconservative model was the anti-interventionist biases of neoconservative policymakers and the low priority they attached to distributive issues. Concludes that the primary economic lesson provided by the experiences of these countries is the need to define and establish an appropriate balance between the roles of government and the market. Ramos is a Senior Economist, U.N. Economic Commission for Latin America and the Caribbean, Santiago, Chile. Bibliography; index.

RAVENHILL, JOHN, ed. *Africa in economic crisis*. New York: Columbia University Press, 1986. Pp. xiii, 359. \$35.00, cloth; \$13.00, paper. ISBN 0-231-06382-2. JEL 87-0419

Twelve papers assess various proposals aimed at finding solutions to Africa's economic problems. Papers discuss the nature of Africa's development crisis, the World Bank's strategy for accelerated development, the possibility of collective self-reliance, the debate over alternative development strategies for Africa, the food crisis, and Africa's role in the new international division of labor. Four case studies deal with industrial dependence and export manufacturing in Kenya; self-reliance in Tanzanian trade relations, Ghana's economic decline and development strategies, and the political economy of Zaire's debt. The contributors are mainly political scientists. Ravenhill is Senior Lecturer in Government at the University of Sydney. Index.

SINCLAIR, STUART W., ET AL. *Middle East economic handbook*. London: Euromonitor, distributed in the U.S. and Canada by Gale Research, Detroit, Mich., 1986. Pp. 487. \$80.00. ISBN 0-86338-126-X. JEL 87-0420

A handbook of information on the Middle East and sixteen Middle Eastern economies. Provides

a review of the Middle East in a world context and a regional overview of economic and demographic characteristics of these countries. Discusses the national economy, political structure, population and labor force, industry, agriculture, mining, energy, banking and finance, transport and communications network, health and education systems, and foreign trade of Algeria, Bahrain, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Libya, Morocco, Oman, Qatar, Saudi Arabia, Syria, Tunisia, and the United Arab Emirates. A fact file presents recent major economic indicators for these countries. The coauthors are Stuart Sinclair, Norman Bleetman, Paul Hackett, Trevor Maggs, and Michael Wilson. No index.

TAMAMES, RAMÓN. *The Spanish economy. An introduction*. New York: St. Martin's Press, 1986. Pp. xvi, 274. \$35.00. ISBN 0-312-74987-2. JEL 87-0421

English translation of the 16th edition of *Estructura Económica de España* (1985), which has been used as a textbook for Spanish students in the social sciences for many years. Clarifications for readers not living in Spain and a chapter on Spain's accession to full membership in the European Community in June 1985 have been added to this introduction to the Spanish economy. Specific topics include: economic habitat and population; the system of production; the agricultural sector; the industrial sector; and protection; the transport system (transport sector, national and international); and the institutional systems (social system, government, the communities, and Spanish municipalities). Tamames is Professor of Economics, Department of Economic Structure, Faculty of Economics, University of Madrid. Select bibliography; index.

ZAKAI, DAN. *Economic development in Judea-Samaria and the Gaza District, 1983-84*. Jerusalem: Bank of Israel, Research Department, 1986. Pp. vi, 73. Paper. ISSN 0334-245X. JEL 87-0422

Translation of the Hebrew edition (1986). A report on the economic development in Judea-Samaria and the Gaza District during 1983-84. Outlines changes in the main economic indicators, public and private consumption, consumer prices, investment, construction, and population and employment. Also reviews sectoral developments and changes in the balance of payments. No index.

130 ECONOMIC FLUCTUATIONS; FORECASTING;  
STABILIZATION; AND INFLATION

BRAUN, ANNE ROMANIS. *Wage determination and incomes policy in open economies*. Washington, D.C.: International Monetary Fund, 1986. Pp. xix, 380. \$18.50, paper. ISBN 0-939934-75-2.

JEL 87-0423

Examines the nature of wage determination and the problem of securing an economically appropriate development of money incomes in an open industrial economy under a fixed or flexible exchange rate system, focuses on the scope for incomes policy as an adjunct to fiscal and monetary policy. Part 1 surveys and evaluates the industrial countries' use of incomes policy since World War II. Part 2 considers the scope of incomes policy in theory and practice in the 1960s and 1970s as well as its relation to economic theory and the monetarist prescription of indexation of wages. Part 3 looks at wage bargaining institutions, incomes policy, and demand management since the 1960s by way of case studies of large economies (the United Kingdom, Japan, West Germany, and Canada) and of small economies (Austria, the Netherlands, and Norway). Proposes that the less favorable performance of the industrial economies during the 1970s and early 1980s has been largely a consequence of (1) the historical process of development in the industrial countries and (2) the implementation of macroeconomic demand management policies less appropriate for an integrated international system than in the 1960s. Braun was formerly an economist with the International Monetary Fund. Bibliography; no index.

BRITTON, ANDREW. *The trade cycle in Britain, 1958-1992*. National Institute of Economic and Social Research Occasional Papers, no. 39. Cambridge; New York and Sydney: Cambridge University Press, 1986. Pp. ix, 96. \$24.95. ISBN 0-521-32730-X.

JEL 87-0424

Considers the extent to which periodicity of economic indicators is systematic and significant or merely coincidental. Focuses on three tasks: (1) to bring the theory of periodicity up to date; (2) to define and measure periodicity, using recent British data and, for comparison purposes, recent U.S. and nineteenth-century British data; and (3) to explain the course of the trade cycle in Britain from 1958 to 1982. Reviews the mathematics of periodicity, discusses how periodicity may fit into contemporary trade-cycle theory, and examines statistical methods for dealing with time-series periodicity. Also reviews factors that affect periodicity such as changes in fiscal policy, inflation, and interest rates. Britton is Director of the National Insti-

tute of Economic and Social Research, London. Index.

ECONOMIC COUNCIL OF CANADA. *Changing times: Economic Council of Canada twenty-third annual review, 1986*. Ottawa: Supply and Services Canada, Canadian Government Publishing Centre, 1986. Pp. x, 96. \$6.95, Canada; \$8.35, elsewhere, paper. ISBN 0-660-12184-0.

JEL 87-0425

Annual review highlights key developments and assesses the medium- and long-term prospects of the Canadian economy, comparing them with the potentialities of growth of the economy; also provides an overview of research reported in the Council's other publications. Addresses three main themes: opening new markets and Canada's trade experience and opportunities; rethinking the role of key institutions and government in the regulation of financial institutions, taxation of the corporate sector, social policy, and health care; and reviewing recent and impending difficulties in major resource sectors. Focuses on the importance of adjustment to structural changes occurring in the nation. Concludes with suggestions for improving the functioning of the economy and well-being of Canadians. [See JEL no. 85-0404 for 21st annual review.] No index.

HENRY, E. W. *Multisector modelling of the Irish economy, with special reference to employment projections*. Dublin: Economic and Social Research Institute, 1986. Pp. 169. Ir£ 7.50, paper. ISBN 0-7070-0081-5.

JEL 87-0426

Analyzes the Irish economy and current economic problems by means of a multisector model and historic input-output data. Applies the model to the Irish government data of the Plan year 1987 to check the feasibility and consistency of the Plan's assumptions, results, and policies and to investigate the industrial and employment implications of the Plan. Also uses the model to project what high employment in a future year (i.e., 1992) would imply for exports, imports, GNP, and household and government expenditures. Also analyzes structural changes during 1968-82. General findings are: agreement between the model and Plan for GNP and imports, some disagreement on employment projections, and a large overestimate of government income by the model. Henry is a Research Professor with the Economic and Social Research Institute, Dublin. No index.

INTERNATIONAL MONETARY FUND. *World economic outlook: Revised projections by the staff of the International Monetary Fund, October 1986*. World Economic and Financial Surveys series. Washington, D.C.: Author, 1986. Pp. v, 112. Paper. ISBN 0-939934-78-7.

JEL 87-0427

shorter, updated version of the *World Economic Outlook*, April 1986 [see JEL no. 86-1060 for annotation of seventh annual review]. Examines economic developments in the first half of 1986 and finds them disappointing; however, the general assessment is that the weakness of activity in the finishing of 1986 will give way to a stronger economic performance in the second half of the year. Presents revised projections for 1986 and 1987 for industrial and developing countries and a revised scenario of economic prospects to 2011, reviews key uncertainties (industrial country recovery, risk of a reacceleration of inflation, weakness of primary commodity prices, and import compression in developing countries); assesses the implications of potential tensions regarding demand growth and sustainability in current account imbalances for the current stance of economic policies; and overviews issues on international cooperation. A statistical appendix of aggregate membership data comprises about three-fourths of the review. No index.

GLIANI, FRANCO. *The debate over stabilization policy*. Raffaele Mattioli Lectures series. Cambridge, New York and Melbourne: Cambridge University Press, 1986. Pp. xiv, 271. \$29.95. ISBN 0 521 26790-0. JEL 87-0428

The first in a series of lectures given by distinguished economists and historians at the Luigi Bocconi University, Milan, organized by Banca Commerciale Italiana and in honor of Raffaele Mattioli,

Bank's chairman for many years. Consists of five lectures, summary of discussions, comments by Modigliani, and a biography of Modigliani. The first lecture—Keynesianism, monetarism, and the case for and against active stabilization policies—suggests that there is a need for stabilization policies, that fairly successful stabilization policies are possible, and that the government can be trusted with necessary discretionary power. The second lecture—aggregate demand and the control of the inflationary process, shows how aggregate demand policy can be used to eliminate inflation gradually,

that the question of choosing an optimal path must be faced. The third lecture reviews the monetary system and its relation to the financial structure. The last lecture, on the accumulation of individual and national wealth and the role of social inequality, examines the theory of the consumption function and the importance of capital accumulation. Modigliani is Institute Professor at Massachusetts Institute of Technology. Index.

AL-IMAD, A. *An econometric model of Kuwait's monetary sector*. IBK Papers, Series no. 22. Safat,

Kuwait: Industrial Bank of Kuwait, 1986. Pp. 143. Paper. JEL 87-0429

An econometric model designed to aid in analysis of key monetary variables. Discusses features and problems of econometric modeling of less-developed countries, reviews previous econometric work on Kuwait, outlines issues in application and interpretation, and presents the hypotheses and estimation results. Also outlines certain extensions of the model. Moosa is Manager of the Research and Development International Investment Company. Bibliography, no index.

ROSE, DAVID E. AND SELODY, JACK G. *The structure of the small annual model*. Technical Report series, no. 40. Ottawa: Bank of Canada, 1985. Pp. iii, 306. Paper. JEL 87-0430

Presents a detailed description of the structure and sectoral properties of the Bank of Canada's Small Annual Model (SAM) of the aggregate Canadian economy with complete wealth accounting for medium- to long-term simulation and analysis of aggregate foreign disturbances and domestic monetary and fiscal policy initiatives. Documents how it can be used in simulation with various policy prescriptions and assumptions about model structure. Overviews the background and unique features and presents various aspects of the model concerning: sectoral accounting and government finance, household choices (consumption, labor supply, and real money balances), production (output, factor use, and factor prices), trade (import and supply of net exports and the determination of relative prices, and the effects of exchange rates). The authors are in the Bank of Canada. No index.

SAKSENA, K. D. *Pricing policy and price controls in developing countries*. London: Pinter, Boulder, Colo.: Rienner, 1986. Pp. xv, 240. \$30.00. ISBN 0-931477-85-9. JEL 87-0431

Analyzes some of the basic theoretical and practical issues that arise in the formulation and implementation of pricing policy and of a system of price controls in market economies, particularly with reference to developing economies like that of India. Examines the case for and nature, objectives, and general issues of pricing policy and the theory of price control. Considers: problems and issues in determining controlled prices, marginal vs. average cost pricing; the problem of the rate of return in price-controlled industries, and dual pricing. Also discusses aspects of price controls and pricing policy as well as growth, performance, and pricing

of public enterprises in India. Concludes with a discussion of the study's relevance for those concerned with the formulation and implementation of price control measures, particularly in developing or third world countries. Saksena is Joint Secretary to the Government of India, Planning Commission. Index.

STEWART, MICHAEL. *The age of interdependence. Economic policy in a shrinking world*. Paperback reprint. Cambridge, Mass.: MIT Press, [1983, 1984] 1986. Pp. 192. \$7.95, paper. ISBN 0-262-69103-5. JEL 87-0432

Paperback reprint. [See JEL no. 84-0730 for annotation of the first edition.]

VILARES, MANUEL J. *Structural change in macroeconomic models: Theory and estimation*. Advanced Studies in Theoretical and Applied Econometrics series, vol. 6. Dordrecht, the Netherlands: Martinus Nijhoff; distributed by Kluwer Academic, Hingham, Mass., and Lancaster, England, 1986. Pp. x, 260. \$70.50. ISBN 90-247-3277-8. JEL 87-0433

Aims to show that quantity rationing theory provides the means for improving macroeconomic modeling of structural changes, i.e., for multi-regime models. Posits a new approach for model specification that provides macroeconomic models with the facility to interpret endogenously any structural changes that may occur in an economy. Argues that non-Walrasian macroeconomics can provide a sound theoretical framework for the specification of the model; includes a critical survey of macroeconomic models with quantity rationing. Specifies a model based on the idea that shortages in demand, production capacity, and labor supply are the three bottlenecks in the activities of any firm and therefore in the levels of production and employment in the economy. Selects a capital vintage production function and examines and proposes the econometric techniques to be used in the estimation of the model. Uses the model in case studies of the Portuguese and French economies. Vilares is at the New University of Lisbon and Bank of Portugal, Economic Research Department. Bibliography; index.

WITHERS, WILLIAM. *Politics and economic policy: From Hoover to Reagan*. New York: Carlton Press, 1986. Pp. 240. \$10.95. ISBN 0-8062-2722-2. JEL 87-0434

Traces the history of the changes in economic policies in earlier presidencies and describes how the era of "Reaganomics" was reached. Examines critically the Reagan policies in an attempt to assess whether they will work, and if they do not, then

what programs will insure prosperity, increased production, and the elimination of excessive poverty in the future. Presents a rationale for weighing the consequences of governmental roles in economics, pointing to the failures of Adam Smith, John Maynard Keynes, communism, socialism, and free enterprise. Describes Reaganomics as the first change in economic policy since the New Deal, including lowering taxes, balancing the budget, reducing the economic role of the federal government, deregulating business, reforming the tax system, ending deficit spending, and emphasizing supply-side as contrasted to demand-side economics. Argues for governmental programs to help the disadvantaged and to restore and maintain competition. Concludes that capitalist stagflation will continue to be a problem, and that what "we need is first of all a new ideology, that treasures and seeks to restore freedom to the individual in a corporate society." Withers is Professor Emeritus of Economics at Queens College in New York City. No index.

## 200 Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

BITTANTI, S., ed. *Time series and linear systems. Lecture Notes in Control and Information Sciences series, vol. 86*. Berlin; New York, London and Tokyo: Springer, 1986. Pp. xvii, 243. \$26.40, paper. ISBN 0-387-16903-2. JEL 87-0435

Seven papers provide an overview of advanced topics in the modeling and identification of time series by means of linear systems. Discusses the use of stochastic models in time series analysis, linear errors-in-variables systems, dynamic models for stationary time series, predictive and nonpredictive minimum description length principles, deterministic and stochastic linear periodic systems, numerical problems in linear system theory, and certain recent developments in econometrics. The contributors are: Daniel Boley, Manfred Deistler, Edward G. Hannan, Michael J. McAleer, Giorgio Picci, Stefano Pinzoni, Jorma Rissanen, and the editor and are mainly statisticians. Bittanti is in the Department of Electronics, Milan Polytechnic, Italy. No index.

GRANGER, C. W. J. AND NEWBOLD, PAUL. *Forecasting economic time series*. Second edition. Economic Theory, Econometrics, and Mathematical

Economics series. Orlando, Fla.; London; Sydney and Toronto: Harcourt, Brace, Jovanovich, Academic Press, [1977] 1986. Pp. xiv, 338. \$49.50, cloth; \$24.95, paper. ISBN 0-12-295184-0, pbk.

JEL 87-0436

Second edition reflects some of the developments during the decade since the first edition in time-series analysis and forecasting theory and practice, particularly as applied to economics, such as acceptance of time-series procedures in mainstream economic theory, econometric model building, and causality testing. Major changes in the second edition involve the theory and application of multiple series modeling procedures and a review of more recent and advanced topics. Covers the theory of time series, spectral analysis, linear time series models, the theory of forecasting, univariate time series forecasting, forecasting from regression models, multiple series modeling and forecasting, building multiple time series forecasting models, and the combination and evaluation of forecasting models. [For annotation of the first edition, see JEL no. 77-0694.] Granger is with the Department of Economics at the University of California, San Diego. Newbold is with the Department of Economics at the University of Illinois. Author and subject indexes.

HARRISON, S. R. AND TAMASCHKE, H. U. *Applied statistical analysis*. Sydney: Prentice-Hall of Australia, 1984. Pp. xi, 547. \$32.95, paper. ISBN 0-7248-0034-4.

JEL 87-0437

An introductory textbook of applied statistical methods designed to fit the needs of students of economics and business in Australasia. Discusses the nature of statistics, the nature, collection, and presentation of data, and measures of central tendency and dispersion. Covers probability and probability distributions, theoretical sampling distributions, estimation, hypothesis testing, and the analysis of variance. Analyzes the preparation of sample surveys and the nature of sampling. Outlines linear and multiple regression, time-series analysis, decision theory, index numbers, and non-parametric statistics. One section details statistical developments in Australia and New Zealand. Appendices present statistical tables, details of derivations in the text, elementary mathematics, and matrix algebra. Each chapter contains several examples and exercises. The authors are at the University of Queensland. Index.

HJAB, O. *Stabilization of control systems*. Applications of Mathematics series, no. 20. New York; Berlin; London and Tokyo: Springer, 1987. Pp. xii, 129. \$32.00. ISBN 0-387-96384-7.

JEL 87-0438

Textbook for analysis of the "Adaptive LQ Regulator," a special instance of the problem of controlling or stabilizing a system of differential equations in the presence of random disturbances. Outlines basic linear systems theory, basic probability theory, and the construction of the stochastic integral. Discusses problems of filtering and analyzes the Adaptive LQ Regulator. Includes more than 120 exercises (with solutions in an appendix). Hjab is with the Mathematics Department at Temple University. Index.

JUDGE, GEORGE G. AND YANCEY, THOMAS A. *Improved methods of inference in econometrics*. Studies in Mathematical and Managerial Economics series, vol. 34. Amsterdam; Oxford and Tokyo: North-Holland; distributed in the U.S. and Canada by Elsevier Science, N.Y., 1986. Pp. xvi, 291. \$59.00. ISBN 0-444-87936-6.

JEL 87-0439

Analysis of advances in methods of estimation and hypothesis testing. Part 1 deals with the decision theory approach to the choice of estimators and reviews alternative measures of performance. Part 2 addresses inequality estimation and hypothesis testing for a variety of special linear statistical models. Part 3 considers the general statistical model with general linear restrictions. Part 4 examines some sampling results for the Stein family of estimators. Judge is at the University of Illinois and the University of Chicago. Yancey is at the University of Illinois. Index.

## 220 ECONOMIC GROWTH

ENGERMAN, STANLEY L. AND ROBERT A. ROBERTS. *Long-term factors in American economic growth*. Studies in Income and Wealth series, vol. 51. Chicago and London: University of Chicago Press, 1986. Pp. xi, 884. \$79.95. ISBN 0-226-20928-8.

JEL 87-0440

Fifteen papers and discussions presented at a conference on Long-term Factors in American Economic Growth held in Williamsburg, Virginia, in March 1984. Papers focus on the historical process of economic change in nineteenth and twentieth century United States, Canada, and British West Indies. Organized in four main sections: the national product—papers dealing with new estimates of Canadian GNP for 1870–1926 and measuring the transaction sector and transactions costs in the American economy, 1870–1970, capital and wealth—three essays covering U.S. capital stock in the nineteenth century, economic mobility of nineteenth century Utah households, and inheritance

in Butler County, Ohio, 1803–65; population and the labor force—six papers discussing marital fertility control, 1855–1915, the decline in U.S. household fertility, 1750–1900, nutrition and the decline in mortality since 1700, the female labor force and American economic growth, 1890–1980, early nineteenth century population and labor in the British Caribbean, and revised estimates of the U.S. workforce, 1800–60; and sectoral studies—four papers analyzing productivity growth in manufacturing in the American Northeast, 1820–60, output and productivity in Canadian agriculture, 1870–71 to 1926–27, changes in the Canadian railway sector, 1871–1926, and long-term trends in state and local finance in North Carolina, 1800–1977. Contributors are mainly economists and economic historians. Engerman is John H. Munro Professor of Economics and Professor of History at the University of Rochester. Gallman is Kenan Professor of Economics and History at the University of North Carolina. Author and subject indexes.

FRANZ, ALFRED AND RAINER, NORBERT, eds. *Problems of compilation of input-output tables: Proceedings of an International Meeting organized by the Austrian Statistical Society, Baden near Vienna, Austria, 19–25 May, 1985*. Schriftenreihe der Österreichischen Statistischen Gesellschaft, band 2. Vienna: Orac, 1986. Pp. 571. Paper. ISBN 3-85368-787-3. JEL 87-0441

Thirty papers examine compilation problems that arise in the production of input-output tables. In eight parts: the layout of I-O table frameworks, the role of I-O statistics within national statistical systems; reconciliation with national accounts, balancing procedures; methods of extrapolation and problems of intertemporal and international comparability; problems of valuation, construction of tables in constant prices, and the measurement of productivity; the role and use of basic statistics, and the integration of I-O tables with the international system of national accounts. The contributors are mainly statisticians. The editors are associated with the Austrian Central Statistical Office, Vienna. No index.

SLATER, PAUL B. *Large scale data analytic studies in the social sciences*. Santa Barbara, Calif.: University of California, Community and Organization Research Institute, 1986. Pp. 153. \$30.00, paper. JEL 87-0442

Twelve studies, nine published previously, examine the use of various analytical techniques to discern structural patterns in large data sets of socioeconomic relevance. Subjects and/or data sets explored are: residential sales prices, the petroleum trade in 1970, determination of groups of

functionally integrated industries, the network structure of the United States input-output table, comparisons of aggregation procedures for interaction data, global trade patterns, U.S. metropolitan mortality, U.S. intercounty migration flows, point-to-point migration functions and gravity model re-normalization, world population distribution, international migration and air travel, and citations between scientific journals. Slater is at the Community and Organization Research Institute, University of California, Santa Barbara. No index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT. *Yearbook of international commodity statistics, 1985*. New York: United Nations, 1985. Pp. xviii, 577. \$52.00, paper. ISBN 92-1-112215-5. JEL 87-0443

Second edition of disaggregated statistical series for the world, regional, and country levels for trade in selected agricultural primary commodities and minerals, ores, and metals, including production and consumption series for the latter. Contains additions, revisions, and some corrections to the first edition, as well as new tables covering various years from 1960 through 1983. Consists of summary tables on shares and trade values; tables on agricultural primary commodity trade in food and beverages and in agricultural raw material, and tables on minerals, ores, and metals statistics by regions and countries for aluminum, copper, iron, manganese, nickel, phosphate, sulphur, and tin. No index.

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION. *Input-output tables for developing countries*. Volume II. New York: United Nations, 1985. Pp. ix, 316. \$21.00, paper. ISBN 92-1-106205-5. JEL 87-0444

Input-output tables for fourteen developing countries: Argentina, China (Taiwan Province), Egypt, Fiji, Guatemala, Haiti, India, Indonesia, Morocco, Nicaragua, Rwanda, Singapore, Thailand, and the United Republic of Tanzania. Most tables are for various years of the early 1970s. Also discusses problems of comparability, classification, and standardization. No index.

WESTFALL, GLORIA. *Bibliography of official statistical yearbooks and bulletins*. Government Documents Bibliographies series. Alexandria, Va.: Chadwyck-Healey, 1986. Pp. 247. ISBN 0-85964-124-4. JEL 87-0445

Bibliographic listing of national official statistical yearbooks and bulletins. Entries are arranged first according to major regions of the world: Africa, the Americas, Asia, Europe, and Oceania, and then according to countries within each region. Each

entry lists availability of information in the following categories: physical environment, demography, economic affairs, political affairs, and social and cultural affairs.

See also: Book Number JEL 87-0606

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

ATCHKASSOV, A. AND PREKSHIN, O. *Two worlds—Two monetary systems*. Moscow: Progress, 1986. Pp. 251. JEL 87-0446

Translated from the Russian. Comparative analysis of socialist and capitalist monetary systems and international monetary relations. Discusses the basic laws of development and the present structure of the capitalist monetary system and relations, the crisis of the system, and the foreign-exchange crisis. Examines the distinguishing features of the formation of the foreign-exchange and monetary system of socialism, the CMEA system of international settlements, international socialist credit, and the monetary system of socialism, and monetary systems of the U.S.S.R. and the United States. Discusses the main differences in organization of the Soviet and American banking systems. General conclusions are: that the capitalist world crisis has escalated since the collapse of the Bretton Woods system because the capitalist world has been unable to find an adequate substitute for gold as a core for the existing or any new monetary system. Atchkassov is Deputy General Manager and Prekshin is Manager, U.S.S.R. Bank for Foreign Trade. No index.

BLACK, DEBORAH G. *Success and failure of futures contracts: Theory and empirical evidence*. Monograph Series in Finance and Economics, Monograph 1986-1. New York: New York University, Graduate School of Business, Salomon Brothers Center for the Study of Financial Institutions, 1986. Pp. 70. Paper. ISBN JEL 87-0447

Develops a model to explain the success or failure of new futures contracts, the framework synthesizes both commodity and contract characteristics. Reviews existing literature; specifies a model of the determinants of contract success, tests the hypotheses using a cross-section model of the average daily volume of trading for each innovation (as a measure of success) as a function of relative residential risk, liquidity of the cross hedge, cash price volatility, and cash market size; and uses the model to forecast success or failure of a new con-

tract. Finds that the model accounts for 85 percent of the variability in trading volume and that it could be used as a predictive tool in analyzing potential new contracts. Black is Assistant Professor of Economics, Hunter College of the City University of New York. No index.

BREALEY, R. A. *An introduction to risk and return from common stocks*. Second edition. Cambridge, Mass.: MIT Press, [1969, 1983] 1986. Pp. 188. \$7.95, paper. ISBN 0-262-52116-4. JEL 87-0448

Paperback reprint of the second edition. [For annotation of the second edition, see JEL no. 83-0780.]

CAMPBELL, COLIN D. AND DOUGAN, WILLIAM R., eds. *Alternative monetary regimes*. Baltimore and London: Johns Hopkins University Press, 1986. Pp. xi, 251. ISBN 0-8018-2887-2. JEL 87-0449

Six papers, each with two commentary essays, originally presented at a conference at Dartmouth College in August 1984. The introduction by the editors discusses the rational expectations approach and how the predictability of monetary policy may affect the attainment of the economic goals of full employment and price-level stability. Robert Barro analyzes the inherent logic of a purely discretionary regime. Anna J. Schwartz's paper summarizes the history of the gold standard and examines the proposal that the United States return to such a standard. Richard N. Cooper discusses the internal and external implications of the gold standard. The paper by Allan Meltzer discusses the U.S. from 1890 to 1914, the stability of money and price levels under different regimes. David E. Rapch discusses the reserve discretion of the Federal Reserve. Robert E. Hall proposes a new monetary regime. The authors are: Campbell is Loren M. Berry Professor of Economics, Dartmouth College; Dougan is Visiting Professor, Center for the Study of the Economy and the State, Graduate School of Business, University of Chicago. Index.

CLOWER, ROBERT W. *Money and markets: Essays by Robert W. Clower*. Paperback edition. Edited by DONALD A. WALKER. Cambridge, New York and Melbourne: Cambridge University Press, [1984] 1986. Pp. xv, 277. \$10.95, paper. ISBN 0-521-33560-4. JEL 87-0450

Paperback reprint. [See JEL no. 85-0757 for annotation. See JEL, September 1985 (Vol. 24, no. 3), p. 1247 for review.]

DAVIS, E. P. *Portfolio behaviour of the non-financial private sectors in the major economies*. BIS Eco-

omic Papers series, no. 17. Basel, Switzerland: Bank for International Settlements, Monetary and Economic Department, 1986. Pp. 140. Paper.

JEL 87-0451

Analyzes the behavior of financial asset and liability accumulation and portfolio selection of the personal and company sectors, uses annual data for the period 1966-84 for stocks of financial assets held by these sectors in the United States, the United Kingdom, West Germany and Japan. Discusses the behavior of the size of sectoral portfolios over recent years and assesses econometrically the determinants of portfolio size according to the paradigm of a dynamic portfolio model. Considers recent developments in financial markets. Proceeds to analyze composition, determinants of portfolio distribution, and portfolio instability, and assess the significance and universality of trends in financial markets. Finds that despite differences in actual holdings, the underlying determinants of asset and debt holdings are broadly comparable across the four economies studied. Concludes that differences observed in portfolio holdings result largely from different financial conditions. Also available in French. No index.

FELDMAN, ROBERT ALAN. *Japanese financial markets: Deficits, dilemmas, and deregulation*. Cambridge, Mass., and London: Cambridge University Press, 1986. Pp. x, 245. \$27.50. ISBN 0-262-06104-X.

JEL 87-0452

Describes and analyzes domestic and international aspects of the process of financial market integration in Japan over the past fifteen years. The main theme is that, in both domestic and international markets, repeating cycles of market pressure, innovation, and deregulation occurred as a result of accumulating fiscal deficits and current account swings. Focuses on financial market accommodation and how market pressures, portfolio adjustments, disintermediations, and readjustments led to enhanced feedback throughout the financial system. Uses an econometric model built within the portfolio-balance framework to analyze innovation, deregulation, the loan market, and monetary policy. Considers different approaches to internationalization (regulatory, quantity, and price) and develops a model that modifies the portfolio-balance model by building a set of interlocking balance sheets with domestic and foreign assets and then adds internationalization as a new sector to the balance sheets. Concludes with a discussion of the future of the Japanese financial system and the benefits and costs of enhanced feedback and interest-rate arbitrage. Feldman is an economist at the International Monetary Fund. Index.

FIRTH, MICHAEL AND KEANE, SIMON M., eds. *Issues in finance*. Oxford: Allan; distributed in the U.S. and Canada by Humanities Press, Atlantic Highlands, N.J., 1986. Pp. x, 269. Paper. ISBN 0-86003-643-X.

JEL 87-0453

Intended to complement introductory and intermediate textbooks in finance, emphasizes the institutional setting and empirical research in Britain. Topics of the nineteen papers are: theories of modern finance (efficient markets, portfolio theory, capital asset pricing); corporate financial management (investment appraisal, corporate borrowing policy, dividend policy, required return on investment projects, equipment leasing, raising equity—the problem of setting the issue price, determinants of corporate bond yields, working capital management, option pricing, financial statement analysis, U.K. taxation and financial decision making, and valuation of shares); international corporate financing, implications and problems of recent empirical research in finance, and the current state of financial knowledge and likely future developments in academic research. Firth is Professor of Accountancy, University of Colorado. Keane is Professor in Business Finance, University of Glasgow. Index.

GOWDA, K. VENKATACHARI. *Eradication of black wealth and black money (A scheme of monetary reform)*. World View Monograph Series, no. 1. Bangalore, India: World View Publications, 1986. Pp. xv, 130. \$5.00.

JEL 87-0454

Argues that the eradication of black wealth and black money (i.e., black market operations) is necessary if the authorities of India are serious about controlling inflation and meeting the objectives of the Seventh Five Year Plan approved by the Planning Commission in September 1985. Proposes a new scheme of monetary reform that would convert black money holdings into new currency to eradicate the stock of black wealth, eliminate spending financed from this source, and cause a fall in prices to the 1960 level. Discusses India's inflationary surge, estimates of black money, attempted remedies, existing remedies, and recent government reports and proposals. Gowda was formerly Professor and Head, Department of Economics, Bangalore University. No index.

GRADY, JOHN AND WEALE, MARTIN. *British banking, 1960-85*. New York: St. Martin's Press, 1986. Pp. xii, 232. \$29.95. ISBN 0-312-10041-8.

JEL 87-0455

Description and analysis of the evolution of the British banking system since 1960. Provides an overview of changes in the economy and in economic indicators during the period 1960-85. Discusses

risk and financial institutions as well as the changes in the control and supervision of the Bank of England. Describes the breakdown of the traditional banking system and the growth of the accepting houses, the new money markets, and other non-clearing banks. Analyzes the sources and impact of recent international problems and identifies major areas of instability. The late John Grady was a Director of Samuel Montagu Ltd. Weale is Research Officer in the Department of Applied Economics, University of Cambridge. Glossary; bibliography; index.

KROUSE, CLEMENT G. *Capital markets and prices. Valuing uncertain income streams.* Advanced Textbooks in Economics series, vol. 25. Amsterdam, Oxford and Tokyo: North-Holland, distributed in the U.S. and Canada by Elsevier Science, N.Y., 1986. Pp. xxi, 359. \$49.00. ISBN 0-444-87931-5.

JEL 87-0456

Textbook in economic analysis outlines the theoretical foundations of the valuation of uncertain income streams. Presents the theory of choice under risk and the achievement of equilibrium in a contingent commodity market economy. Discusses the nature of contingent claim market economies and of complete and incomplete security markets. Reviews efficient sets and linear pricing, and outlines the capital asset pricing model. Covers the relevance of production and capital structure in the theory of the firm, multiperiod consumption and investment, and multiperiod valuation. Krouse is at the University of California, Santa Barbara. Mathematical appendices, index.

MAYCOCK, JAMES. *Financial conglomerates: The new phenomenon.* Gower Studies in Finance and Investment series, no. 2. Aldershot, England, and Brookfield, Vt.: Gower, 1986. Pp. xiv, 106. \$48.50. ISBN 0-566-00820-3.

JEL 87-0457

Traces the development of financial conglomerates, particularly in the United States and the United Kingdom, over the past three decades, arguing that these institutions have become the rule rather than the exception; considers the factors—especially legal—that have encouraged their formation. Discusses the postwar U.K. financial system, how U.K. clearing banks began the conglomerate trend, competitive pressures, and international aspects. Also reviews other U.K. financial institutions, including insurance companies, discount houses, merchant banks, and the stock exchange. Describes the U.S. legislative framework and compares it with that of the U.K. Discusses the role of deregulation and presents several case studies of both bank lending companies and nonbank finan-

cial conglomerates. Also describes the situation in Australia, Canada, Japan, and West Germany. Finally, discusses the retailing of financial services, current issues and problems, and future perspectives. Concludes that conglomerate form of organization for financial institutions is mainly the outcome of the internationalization of trade and financial flows, rising standards of living, technological advance, and deregulation. Maycock is a former banker and currently is a consultant to the Institute of European Finance at the University College of Wales. Glossary, index.

SHADOW OPEN MARKET COMMITTEE. *Policy statement and position papers. September 21-22, 1986.* Rochester. University of Rochester. Graduate School of Management, Center for Research in Government Policy and Business, 1986. Pp. 62. Paper.

JEL 87-0458

The September 1986 policy statement proposes that: the U.S. long-term problem is not the twin deficits in the government budget and trade imbalance, but that the United States must invest more in productive capital to increase productivity and consume less, eliminate the corporate income tax and substitute a broad-based consumption tax, and reduce the growth rate of the monetary base to a rate consistent with price stability (3 to 4 percent). Three position papers discuss the economic outlook (Jerry L. Jordan), current status and content of the Gramm-Rud-  
Levy, and time concepts (Robert Ras-

SIMPSON, THOMAS D. *analysis.* Third ed. Prentice-Hall, [1986]. ISBN 0-13-600222

Third edition of a text  
ing [see JEL no. 81-0736 for annotation of the previous edition]. Because of their increasing similarities, banks and thrifts are discussed together rather than in different chapters. A new chapter has been added that discusses basic economic functions of depository institutions, such as their role in the monetization of debt, managing balance sheet disturbances, and managing credit risk. The chapter on money and monetary standards has been revised to include a detailed discussion of the evolution of payment systems, indicating how efficiency has come at the expense of greater risk. The chapter dealing with the depository and regulatory systems has been revised completely, focusing on the costs of providing depository services and other current policy issues. Also includes an updated discussion of off-balance sheet activities and interest

rate risk management; a discussion of securities dealers and pension funds; and a discussion of debt and GNP targeting. References, summary, key terms, and questions for thought and discussion at end of each chapter. Simpson is with the Federal Reserve Board. Index.

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

BROWNING, EDGAR K. AND BROWNING, JACQUELENE M. *Public finance and the price system*. Third edition. New York: Macmillan; London: Collier Macmillan, [1979, 1983] 1987. Pp. xvi, 537. \$29.00. ISBN 0-02-315720-8. JEL 87-0460

Third edition of an introductory public finance textbook that treats both government expenditure and tax policies. Requires no prerequisites but previous coursework in intermediate microeconomic theory may be helpful. Significant changes from the previous edition include: new sections on subsidies to higher education and value added taxation, expanded treatment of government deficits and poverty, new material on corporation and individual income taxes to reflect recent developments in tax policy, and end-of-chapter questions. [For annotation of the previous edition, see JEL no. 84-0436.] The authors are at Texas A&M University. Index.

GOSS, CHRISTOPHER. *Petroleum and mining taxation: Handbook on a method for equitable sharing of profits and risk*. Aldershot, England, and Brookfield, Vt.: Gower, 1986. Pp. xiv, 69. \$39.95, paper. ISBN 0-566-05269-5. JEL 87-0461

Guide to the application of U.K. Additional Profits Tax (APT) to mining and petroleum. Discusses the need for special taxation of mining and petroleum, the concepts involved in calculating APT, the step-by-step process of calculation, its features, some of its refinements and alternative forms, its advantages and disadvantages, alternatives to APT, and its use in practice. No index.

HERBER, BERNARD P., ed. *Public finance and public debt: Proceedings of the 40th Congress of the International Institute of Public Finance, Innsbruck, 1984*. Detroit: Wayne State University Press, 1986. Pp. xx, 363. \$40.00. ISBN 0-8143-1810-X. JEL 87-0462

Twenty-seven papers consider the purposes of government spending and the increase in public debt in both socialist and market economies in developing and developed nations. Major subject areas are: (1) macroeconomic and stabilization issues of fiscal deficits as generators of public debt; (2) issues of allocational efficiency as they relate to

public debt and are linked to economic stabilization; (3) interaction between public debt and the public choice process; and (4) intergovernmental public debt problems and policies. Some specific topics are: changing concepts of public debt in the history of economic thought; definition and measurement problems; public debt trends in the United Kingdom; the limit to deficit size in developing countries; indexation of government debt; government expenditure growth; intergenerational debt burden distribution; public enterprises and off-budget debt; and debt management in small open economies. The welcoming address and one paper are in French. The editor is at the University of Arizona. No index.

HOLTON, ROBERT J. AND TURNER, BRYAN S. *Talcott Parsons on economy and society*. New York and London: Routledge and Kegan Paul, 1986. Pp. vii, 276. \$50.00. ISBN 0-7102-0746-8. JEL 87-0463

This study of the contributions of the late Talcott Parsons grew out of a series of seminars in sociology at Flinders University, South Australia. Five essays by the authors and a contribution by Roy Fitzhenry reappraise Parsons's impact on modern sociology. Focuses on Parsons's outline of a map of the "social," which called for both defining the boundaries between society and organic life and describing the internal exploration of social relations between culture, personality, and social structure with the objective of application, extension, elaboration, and comparison. Examines Parsons's analysis of medicine in relation to society. Also discusses his views on religion, theodicy, and death in relation to the sociology of modern societies. Analyzes Parsons in terms of *Verstehen*—the methodology of subjective understanding—and its role in the concept of social action. Examines the many criticisms of Parsons and discusses Parsons's contributions toward sociology for a modern world, arguing that he was not an apologist for "cross economic individualism," but rather sought to determine the value inputs and normative rules that regulate economic life and prevent the unilateral operation of a utilitarian social order. Holton is Senior Lecturer in Sociology and Turner is Professor of Sociology, both at Flinders University. Bibliography of Parsons's works. Bibliography, index.

HYMAN, DAVID N. *Public finance: A contemporary application of theory to policy*. Second edition. Chicago; Montreal; London and Sydney: Holt, Rinehart and Winston; Dryden, [1983] 1987. Pp. xxi, 634. ISBN 0-03-007498-3. JEL 87-0464

Second edition of an introductory textbook in public finance. Changes from the previous edition

include: more graphic analysis, increased analysis of government expenditure programs, improved treatment of the theory of taxation; better coverage of income taxation; a new chapter on budget deficits; boxed analyses of important current issues, and end-of-chapter problems. [See *JEL* no. 83-0406 for annotation of first edition.] Hyman is at North Carolina State University. Glossary; name and subject indexes.

KANTIL, RAJANI KANNEPALLI. *Political economy and laissez-faire: Economics and ideology in the Ricardian era*. Totowa, N.J.: Littlefield, Adams, 1986. Pp. 200. \$34.50. ISBN 0-8476-7488-6.

*JEL* 87-0465

Presents an interpretation of the economic theories and conflicts of early and mid-nineteenth century England. Examines classical use of laissez-faire as a technique for dismantling the existing political structure with its various regulations that inhibited unrestricted growth of capital. Analyzes economics as policy, describing classical economics as "in reality an empirically specific 'political' science of transition in the dynamic social context of early nineteenth century England." Cites the Poor Laws and the Corn Laws and the social classes they protected as crucial areas of interest for the classical economists who viewed these laws as "inefficient agencies in their scheme of social progress." Argues that in reality classical economics was an ideology in defense of bourgeois interests. Concludes that the philosophy of laissez-faire was "a uniquely efficient device in securing classical objectives." Originally written as a Ph.D. thesis at the New School for Social Research in 1980. Kanth is Assistant Professor of Economics at the University of Utah. Bibliography, index.

LANDAU, RALPH AND JORGENSEN, DALE W., eds. *Technology and economic policy*. Cambridge, Mass.: Harper and Row, Ballinger, 1986. Pp. xvi+344. \$29.95. ISBN 0-88730-068-5. *JEL* 87-0466

First publication from the Program on Technology and Economic Policy, established at the Kennedy School of Government, Harvard University, in September 1984. Volume is based on the proceedings of a Conference on Technology and Economic Policy, held in Washington in 1985, convened to develop an understanding of the interrelationships between current issues in economic policy and technological innovation and emphasizing the impact of taxation on the rate of innovation, especially corporate income taxes and their effects on venture capital and capital costs. Also considers the impact of the federal deficit on the financing of new investment and technology. Fourteen essays cover topics such as: technology, eco-

nomics, and public policy, tax policies for the eighties; federal tax policy and the budget; corporate income tax reform, incentives and windfalls in corporate tax reform; tax policy influence on venture capital; attacks on capital gains taxation benefits, capital gains taxation and its incentive to growth, the accelerated recovery system, investment tax credit, capital cost recovery system, and neutral cost recovery system and their effects in an inflationary economy; budgets, deficits, technology, and economic growth, financing American investment in new technology, causes, effects, and remedies for the gap in the cost of capital, the relative impact of taxation and interest rates on the cost of capital, and the Treasury tax reform plan. The contributors are mainly economists. Landau is with Lastowel Incorporated and an adjunct Professor at the University of Pennsylvania. Jorgenson is the Frederic Eaton Abbe Professor of Economics at Harvard University. Index.

LEE, DWIGHT R., ed. *Taxation and the deficit economy: Fiscal policy and capital formation in the United States*. Foreword by MICHAEL J. BOSKIN. Pacific Studies in Public Policy series. San Francisco, Calif.: Pacific Research Institute for Public Policy, 1986. Pp. xxvii, 554. \$34.95, cloth \$14.95, paper. ISBN 0-936488-13-1. *JEL* 87-0467

Eighteen papers concentrate on: (1) the economic consequences of U.S. fiscal policy, especially regarding its consequences for capital formation, and (2) the politics of the fiscal process itself. Five papers consider the economic effects of taxation, seven discuss spending, deficits, and other forms of hidden taxation, and six discuss entrepreneurship in the private sector. The first paper discusses the roles of taxation in the private sector. The last paper focuses on the effects of virtual rights versus real rights. Tax reforms include: a new system with a tripartite structure, a new constitutional and federal budget and federal budget spending, consideration of a new scheme for the Social Security program, and reduction of military spending without compromising national security. The contributors are economists. The editor is Professor of Economics and holder of the Bernard B. and Eugenia A. Ramsey Chair of Private Enterprise, University of Georgia. Index.

LINDHOLM, RICHARD W., ed. *Examination of basic weaknesses of income as the major federal tax base*. New York and London: Greenwood Press, Praeger, 1986. Pp. xv, 320. \$37.95. ISBN 0-275-92148-4. *JEL* 87-0468

Eleven papers identify and examine the sources of economic instability and inefficiency of a federal tax system based on profits and income, and assess reform possibilities in light of the existing mismatch between the income sources of the U.S. federal government and its spending and management needs. Topics include: growth and failure of the income tax; federal individual income tax collection costs; the complexity, verbosity, and progressivity of the Internal Revenue Code; the value-added tax alternative; expanded income tax withholding; federal income tax evasion; the adjustability of the tax system; the underground economy in the United States and Western Europe; economic assessment of the president's 1985 tax reform proposal; the concept of income realization and deductible costs; and roots of the existing federal corporate income taxes. The contributors are taxation specialists. Lindholm is Professor of Finance and Emeritus Dean of the College of Business Administration, University of Oregon. Index.

LYBECK, JOHAN A. *The growth of government in developed economies*. Aldershot, England, and Brookfield, Vt.: Gower, 1986. Pp. xiv, 257. ISBN 0-566-05178-8. JEL 87-0469

Combines economics and political science in explaining the growth of government. Views the growth of government as the result of several societal interactions—between voters, elected bodies, interest groups, and the government. Examines significant increase in the public sector since the Second World War in the OECD countries. Presents a description of Sweden's experience with social and economic experiments. Discusses both short- and long-run causes for public expenditures and the growth of government and surveys constitutional restraints in various countries on the growth of government. Raises questions about voting rights and the principle of majority rule in democracies. Concludes that "... it appears rather meaningless to discuss limitations on the total size of the government sector. Instead, the discussion on demands of particular public goods and services and their financing should be focused on." Parts of the book constitute portions of the author's doctoral thesis in political science and several of the chapters have been published previously. Lybeck is Senior Vice President of SwedBank, Stockholm. Author and subject indexes.

MILLS, EDWIN S. *The burden of government*. Stanford, Calif.: Stanford University, Hoover Institution Press, 1986. Pp. x, 188. \$23.95. ISBN 0-8179-8281-7. JEL 87-0470

Economic analysis of the many roles governments play in contemporary societies. Explores,

using economic theory, what governments should and should not do to achieve desirable economic goals. Emphasizes the distinction between positive and normative economics, stating that most "of this book is about what private groups can do better than governments and what governments can do better than private groups." Presents a factual background depicting the growth of governments during the late nineteenth and twentieth centuries, focusing primarily on the United States. Analyzes social efficiency from the perspective of what governments need to do to achieve this objective. Examines the notion of equity, suggests governmental actions that would improve equity in the United States, and discusses the issue of optimum income distribution. Explores specific areas of government activity, including government macroeconomic policies affecting unemployment, inflation, and growth and the effects of both federal and state and local regulations. Describes the role of government in poor countries. Concludes that government "excesses impair social efficiency of the economy, slow economic growth, and make the economy less equitable than it should be. In the process, governments deprive citizens of precious economic and political freedoms." Mills is Professor of Economics at Princeton University. Bibliography; index.

PECHMAN, JOSEPH A. *The rich, the poor, and the taxes they pay*. Boulder, Colo.: Westview Press, 1986. Pp. xvi, 317. \$40.00. ISBN 0-8133-0376-1. JEL 87-0471

Presents the results of the author's research on the distribution of the U.S. tax burden and about the unique features of the federal tax system. Examines the distribution of the tax burden, 1966-85; individual income taxation; tax issues such as capital gains and losses, adjusting for inflation, consumption expenditure, taxes, value added taxation, and tax-based income policies; financing a federal system; income maintenance, with attention to its practicality and the New Jersey experience, Social Security; and a comparative review of tax programs abroad, particularly Japan and Great Britain. Concludes that the federal income tax is only mildly progressive and has not moderated income inequality to any significant degree. Finds that the system of transfer payments is highly progressive. Recommends an increase in the progressivity of the tax system. Pechman is a Senior Fellow and formerly Director of Economic Studies at the Brookings Institution. Index.

PETERSON, GEORGE F., ET AL. *The Reagan block grants: What have we learned?* Changing Domestic Priorities Series. Washington, D.C.: Urban In-

stitute Press, 1986. Pp. xviii, 134. Paper. ISBN 0-87766-400-5. JEL 87-0472

Part of a series of studies examining changes that are taking place in the nation's domestic policies under the Reagan administration. Examines the history of state and local programs folded into block grants for health and human services. Discusses funding for these programs from other sources. Presents an overview of the history of block grants and the Reagan approach. Indicates only minimal success to date, with only one initiative succeeding—the replacement of CETA by the Job Training Partnership Act of 1982. Attributes most of the failure of the program to the political concern that it means budget cutting. Cites transportation as a case where the block-grant proposal has not been considered on its intrinsic merits because it is linked to steep cuts for mass transit. Randall R. Bovbjerg, Barbara A. Davis, and Peterson all are with the Urban Institute. Eugene C. Durman is with the Environmental Protection Agency. Theresa Gullo is an analyst at the Congressional Budget Office. No index.

SHOME, PARTHASARATHI, ed. *Fiscal issues in South-east Asia: Comparative studies of selected economies*. Singapore; Oxford; New York and Toronto: Oxford University Press, 1986. Pp. x, 237. \$32.00. ISBN 0-19-582655-8. JEL 87-0473

Eleven papers (three previously published) discuss topics relating to fiscal policy in countries of Southeast Asia. The papers in part 1 review the economic structure of these countries and discuss the nature of changes in the structure of taxation that occur with economic development. Part 2 deals with the impact of tax incentives for the promotion of investment and employment. Part 3 discusses the design and incidence of corporate income taxes, while part 4 examines agricultural, mineral development, and excise taxes. Part 5 covers the design, coordination, and impact of fiscal policy and social security institutions. Contributors are: Jonas N. Agell, Mukul Asher, Anne Booth, Sheetal K. Chand, Craig Emerson, Mark J. Ferron, Ved P. Gandhi, Ichiro Otani, Vito Tanzi, and the editor. Shome is an economist at the International Monetary Fund. Bibliography; index.

VIÑALS, JOSÉ. *Fiscal policy and the external constraint*. Documento de Trabajo, no. 8706. Madrid: Banco de España, 1986. Pp. 81. Paper. ISBN 84-505-3941-2. JEL 87-0474

Paper presented before the Economic Policy Panel in Paris in April 1986 studies the link between budget deficits and current account deficits from both theoretical and empirical points of view. Main conclusion is that this link is not automatic

and exists only when budget deficits are transitory and debt financed. Validates conclusion with empirical data for the United States, West Germany, France, Spain, and the United Kingdom. Asserts that the most important policy implication is that it is possible to manage fiscal policy to reach the desired internal balance goals without damaging the external position of the economy. Notes that high unemployment currently is the most important problem faced by European economies, having succeeded in reducing high rates of inflation. Considers both short- and long-run aspects, considering the divergences between private and social costs, the stickiness of wages and prices, the effects on financial markets, the influence of debt crisis and protectionism, and the problem of future flexibility. Viñals is with the Banco de España and Stanford University. No index.

#### 400 International Economics

GONDOLF, EDWARD W., MARCUS, IRWIN M. AND DOUGHERTY, JAMES P., eds. *The global economy Divergent perspectives on economic change*. Boulder, Colo., and London: Westview Press, 1986. Pp. xvii, 212. \$28.50, paper. ISBN 0-8133-7188-0. JEL 87-0475

Nineteen papers discuss the implications for social and political institutions of the economic changes of the global economy. One paper presents global economy views regarding the economy and development, the impact of the steel industry on the economy in terms of internationalization. Eight papers discuss possible solutions to the major dilemmas created by the global economy. Topics include: the impact on labor, the social costs for women and blacks, and proposals for revitalization. Two papers assess these divergent perspectives and present an alternative to the global economy. The contributors are social scientists. Gondolf is Associate Professor of Sociology, Marcus is Professor of History, and Dougherty is Sociology Instructor, all at the Indiana University of Pennsylvania. No index.

[PATEL, SURENDRA] *World economy in transition: Essays presented to Surendra Patel on his sixtieth birthday*. Edited by KRISHNA AHOOJA-PATEL, ANNE GORDON DRABEK, AND MARC NERFIN. Oxford; New

York; Toronto and Sydney: Pergamon Press, 1986. Pp. xix, 293. \$33.00. ISBN 0-08-031285-3.

JEL 87-0476

Nineteen essays in honor of Surendra Patel, formerly of the Technology Division of UNCTAD, on managing the changing economic and political relationships at the world level. Topics include: the dynamic role of the periphery; lessons of development economics; rise of the South-East and decline of the North-West; economic distance and the living standard; energy and international security in the 1980s; the North-South negotiation process; a Southern view of growth of world trade in manufactures; the global power of transnational conglomerates; African, Asian, and Latin American perspectives on development; and theory and policy of the transfer of technology. Many of the contributors are currently or were formerly associated with the United Nations. Ahooja-Patel is Editor of *Women at Work*, ILO, Geneva, Switzerland. Drahek is Managing Editor, *World Development*, Washington, D.C. Nerfin is President, International Foundation for Development Alternatives, Nyon, Switzerland. Index.

RESEARCH AND INFORMATION SYSTEM FOR THE NON-ALIGNED AND OTHER DEVELOPING COUNTRIES. *World economy in the mid-eighties: A report prepared as background document for the eighth summit of the heads of non-aligned states, Harare, 3-7 September 1986*. New Delhi: Author, 1986. Pp. xii, 222. \$25.00, paper. JEL 87-0477

Provides a developing country perspective of the current world economic situation. Part 1 overviews the world economy. Part 2 consists of reports on selected current issues (international monetary and financial systems, strategies and policies of multilateral institutions, reforms of the international monetary and financial system, issues and policy options related to trade in services, and an agenda for action regarding the African economic crisis). Part 3 contains a statistical profile of developing countries. No index.

#### 410 INTERNATIONAL TRADE THEORY

See also: Book Number JEL 87-0404

#### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

DESTLER, I. M. *American trade politics: System under stress*. Washington, D.C.: Institute for International Economics; New York: Twentieth Century Fund, 1986. Pp. xiii, 366. \$18.00, paper. ISBN 0-88132-057-9. JEL 87-0478

Analyzes postwar United States trade policy and where it may be headed, as well as its roots and

political aspects. Focuses on the politics of imports. Assesses the interaction between Congress and the executive branch resulting from the former's delegation of responsibility for specific trade decisions. Also discusses the interactions between domestic and international considerations, the linkages between trade policy and exchange-rate determination and other macroeconomic policies, and the ties between trade economics and trade politics. Examines the erosion of trade policy over the past fifteen years, aggravated by the large U.S. trade deficits of these years. Considers future prospects for freer trade as bleak—with more negotiated barriers to imports and increased demands on foreign governments. Suggested prescriptions include attention to U.S. domestic macroeconomic policies, particularly the federal deficit; realignment of currencies and movement toward more structured cooperation on exchange rates, and changes in Congressional procedures. Destler is a Senior Fellow at the Institute for International Economics. Glossary, index.

DICKSON, BRUCE AND HARDING, HARRY, eds. *Economic relations in the Asian-Pacific region: Report of a conference cosponsored by the Chinese Academy of Social Sciences and the Brookings Institution, June 1985*. Brookings Dialogues on Public Policy series. Washington, D.C.: Brookings Institution, 1987. Pp. ix, 91. Paper. ISBN 0-8157-1841-1. JEL 87-0479

Excerpts from twelve papers and comments on trade patterns and economic trends in the Pacific Basin. Comments are organized into three units. The first deals with economic trends, including prospects for the developing economies of East Asia, the impact of Japanese and American economic policies, and North-South relations and protectionism. The second section examines Chinese domestic reforms and the open economy policy, including reforms in agricultural policy, industrial management, and planning undertaken since 1978 in the attempt to attract foreign trade and technology. The last section deals with implications for relations between the United States and China, noting the relative decline in the importance of strategic and military issues. Dickson is a Research Assistant and Harding is a Senior Fellow, both at the Brookings Institution. No index.

HASSE, ROLF H. *Econometrics in the service of economic interests: On the validity of the UNCTAD calculations of the trade effects of the Tokyo Round on developing countries*. Schriften zur Wirtschaftspolitik, Neue Folge, Band 3. Stuttgart, West Germany, and New York: Fischer; distributed in the

U.S. and Canada by VCH, Deerfield Beach, Fla., 1986. Pp. x, 102. DM 38.00, paper. ISBN 3-437-50308-1.

JEL 87-0480

Presents an analysis of the UNCTAD (United Nations Conference in Trade and Development) study, particularly its calculations, of the trade effects of the Tokyo Round on developing countries. Finds a bias in the UNCTAD study because it "is in UNCTAD's interest to demonstrate that since reduction in the most-favored-nation tariffs will lead to an erosion of preference margins the Tokyo Round will have an adverse effect on trade in industrial goods." Criticizes the UNCTAD calculations for containing gross errors, weaving standpoints of interested parties into the theoretical framework, and the selection of data. Carries out alternative calculations to reveal the scale of errors. Also criticizes the study for calculating only the static effects of tariff preferences and for failing to consider a variety of other factors, such as the use of weighted customs tariffs and the trade substitution effect. Argues that the Tokyo Round will have positive trade effects for developing countries, despite the erosion of trade preferences. Hasse is a Professor at the University of the Federal Armed Forces Hamburg. Index.

HAUSER, HEINZ, ed. *Protectionism and structural adjustment*. Swiss Institute for Research into International Economic Relations, Economic Structures, and Regional Science series, no. 12. Grösch, Germany. Rüegger, 1986. Pp. 312. Paper. ISBN 3-7253-0277-4.

JEL 87-0481

Eleven papers and summaries of the session discussions of the third St. Galler Forschungsgespräche at the St. Gall Graduate School of Economics, Law, Business and Public Administration in September 1985. Published simultaneously as no. 2/3 of the 1986 volume of *Aussenwirtschaft*. Papers analyze the relationships between frictions in structural adjustment and protectionist pressures; a central theme is the politics of the formation of foreign trade policies in the context of domestic representation of special interest groups. Topics include: domestic policy foundation and function of international trade rules; the costs and benefits of protection; industrial and trade policy in a period of rapid structural change; trade protection in the United States; interest groups, government, and the politics of protectionism, rentseeking and trade protection; integration and protectionism; GATT surveillance of industrial policies; more efficient procedures for multilateral trade negotiations; trade policy as a constitutional problem; and international trade disputes and the individual. Contains abstracts in German. The editor is Professor at Schweizerisches Institut für Aussenwirtschafts-

Struktur-und Regionalforschung, University of St. Gallen. No index.

HUBBARD, MICHAEL. *Agricultural exports and economic growth: A study of the Botswana beef industry*. London: KPI, distributed by Associated Books, Routledge and Kegan Paul, London, Routledge and Kegan Paul Methuen, New York and Routledge and Kegan Paul, Methuen Law Book Company, North Ryde, Australia, 1986. Pp. xx, 284. \$25.00. ISBN 07103-0121-9.

JEL 87-0482

Examines the role of Botswana's cattle and beef export industry in the evolution of Botswana since 1900. Part 1 provides background on the international beef trade and cattle trade and cattle production in Botswana. Part 2 presents the history of the sector, characterizing it as a reserve industry on the South African periphery from 1900-49 and as a growth industry within a still peripheral economy from 1950 to the present. Finds that the expansion of cattle production in the postcolonial period was accompanied by growing social costs in terms of public resource allocation, resource use, and resource distribution. A conclusion is that the export-local subsistence conflict is a symptom of a land shortage. Hubbard is a Lecturer, Development Administration Group, Institute of Local Government Studies, University of Birmingham. Glossary, select bibliography, index.

C. D. HOWE INSTITUTE. *Policy harmonization: The effects of a Canadian Area*. Toronto: Author, 1986. Canada, Scarborough. \$12.00 paper. ISBN

Seven papers on the establishment of a Canada and the United States. Murray Smith and pressures on Canada to harmonize its policies with the United States. The implications of a free trade policy and fiscal sovereignty. The impact of U.S. trade laws on Canadian economic policies, and Murray Smith outlines the implications of a free trade area agreement for Canadian commercial policy. Steven Globberman reviews certain trade issues that could complicate Canadian cultural support policies, while Richard Barchello and T.K. Warley analyzes the possible impact of freer trade on Canadian agricultural policies. Also contains an introductory overview by Lapsey and Smith. No index.

ISOTAI, ANDRÁS. *Regional integrations in the new world economic environment*. Translated by KA-

HOLY KERNFESI. Budapest: Akadémiai Kiadó, 1986. Pp. vii, 286. \$29.00. ISBN 963-05-4353-2.

JEL 87-0484

Updated translation of *A regionális integrációk az új világgazdasági helyzetben* (1980). Examines the impact that changes in the world economic environment have had on regional economic integration, and how integration, while contributing to bringing about the changes, also fell victim to their consequences; reflects statistics as of 1981-82. Discusses attempts at regional economic integrations and world economic changes since 1973 relating to issues, trends of intraregional trade, development of monetary cooperation, security of regional self-sufficiency in raw materials and food supply, integrational industrial development, regional-level control of international capital flow, and external economic activities. Considers the place of regional integration in the world economic division of labor and future prospects of regional integration. General conclusions are that: the original goals and actual achievements of integration do not sufficiently coincide; not only the factors of production but also goods have different propensities for integration; and comparative advantages of member states do not necessarily coincide with those that could be derived from the international division of labor. No index.

JENTLESON, BRUCE W. *Pipeline politics: The complex political economy of East-West energy trade*. Cornell Studies in Political Economy series. Ithaca and London: Cornell University Press, 1986. Pp. 263. \$29.95. ISBN 0-8014-1923-9.

JEL 87-0485

Examines the extent to which United States and its NATO allies should trade with the Soviet Union and what constitutes power and how is this influence achieved. Presents the conceptual framework for the analysis of the politics of East-West energy trade. Examines East-West trade during the Cold War years (1945-53), assessing the impact of anti-Soviet sanctions. Reviews events such as the first period of growing East-West energy trade in the mid-1950s, the politics and policy consequences of the 1962-63 oil trade sanctions, the development of East-West trade in oil and natural gas in the 1970s, and the Western alliance and American domestic politics of the Reagan administration's sanctions against the Siberian natural gas pipeline, indicating both their intended and actual results. Reexamines the theoretical and policy issues of the East-West energy trade issue. Concludes that in none of the cases reviewed did the sanctions register "overwhelming success," primarily because the Soviets were able to counter them with regional integration and domestic industrialization. Jentle-

son is Assistant Professor of Political Science at the University of California, Davis. Bibliography; index.

KOESTER, ULRICH. *Regional cooperation to improve food security in southern and eastern African countries*. IFPRI Research Report series, no. 53. Washington, D.C.: International Food Policy Research Institute, 1986. Pp. 89. Paper. ISBN 0-89629-053-0.

JEL 87-0486

Review of attempts to improve food security in countries in South and East Africa. Outlines the cooperative approach of the Southern African Development Coordination Conference (SADCC) countries. Discusses the economic theory of integration and the prospects for integrating developing countries. Assesses the impact of integration schemes and examines the nature of obstacles to integration. Investigates the success of regional integration schemes at stabilizing consumption and promoting economic growth and food security. Outlines alternative schemes to stabilize food consumption within the SADCC region. Koester is Professor of Agricultural Economics at the University of Kiel. Bibliography; no index.

LIM, DAVID, ed. *Asian-Australia trade in manufactures*. Melbourne: Longman Cheshire, 1985. Pp. xii, 263. Paper. ISBN 0-582-71147-9.

JEL 87-0487

Twenty papers present the findings of a joint research project by ASEAN and Australian economists on the size, nature, and determinants of trade in manufactures between ASEAN and Australia. Analyzes both interindustry and intraindustry trade during the period 1968-82. Surveys ASEAN-Australia trade and intra-ASEAN trade. Explains patterns of trade in manufactured goods at the macro level by using the constant market share model and examining changes in the region's comparative advantage and trade intensities; estimates import demand functions and the elasticities of substitution for the most important import items for each of the six trading partners. Papers also present a qualitative analysis of the results of surveys of importers in each of the countries as to the factors determining trading patterns. The editor concludes that there is scope for increasing Australia-ASEAN trade. The contributors are mainly economists and statistics and development specialists. The editor is Dean and Professor, School of Modern Asian Studies, Griffith University, Brisbane, Australia. Index.

OVERTURF, STEPHEN FRANK. *The economic principles of European integration*. New York and London: Praeger, 1986. Pp. xlii, 173. \$35.00, cloth; \$12.95, paper. ISBN 0-275-92276-6.

JEL 87-0488

Explains, in light of its historical beginnings, the nature of the contemporary European Community (EC), the political pressures on its policies and institutions, and the economic forces that hold it together and pull it apart. Presents the historical background of European integration, covering the pre-World War I, interwar, and post-World War II periods, with special attention to the European Coal and Steel Community and the European Economic Community. Also examines the various institutions used, such as the Council of Ministers, the European Parliament, and the Court of Justice. Discusses other economic aspects, including customs union theory, factor mobility and tax harmonization, monetary union, industrial policy, and common agriculture policy. Reviews trade relations with developing and more developed nations, with emphasis on tariff negotiations, as well as non-tariff barriers. Concludes with a discussion of regional policy and social policy. Overturf is Professor of Economics at Whittier College. Bibliography; index.

SALVATORE, DOMINICK, ed. *The new protectionist threat to world welfare*. Amsterdam and London: North-Holland; distributed in North America by Elsevier Science, N.Y., 1987. Pp. xvi, 581. \$55.00. ISBN 0-444-01084-X. JEL 87-0489

Twenty-six essays that represent an updated and enlarged version of a special issue of the *Journal of Policy Modeling* (1985). Topics are intended to achieve a balance between theory and empirical results, between the real and monetary sectors, and between the general and the specific. Organized in five parts as follows: An overview of the new protectionism, covering its revival and empirical results, international competitiveness, new protectionism, and welfare, dealing with the changing structure of U.S. trade, employment effects of Japanese and American protectionism and U.S.-Japanese trade frictions; industrial policy and industry studies, with emphasis on high technology, steel, and automobiles, monetary policy, exchange rates, and protectionism; and the new protectionism and economic development. The contributors are mainly economists. Salvatore is at Fordham University. Name and subject indexes.

SAXONHOUSE, GARY R. AND YAMAMURA, KOZO, eds. *Law and trade issues of the Japanese economy. American and Japanese perspectives*. Seattle and London: University of Washington Press; Tokyo: University of Tokyo Press, 1986. Pp. xx, 290. \$40.00. ISBN 0-295-96343-3. JEL 87-0490

Nine essays from a 1983 workshop on legal institutions and U.S.-Japanese economic relations, sponsored by the Committee on Japanese Eco-

nomic Studies. The first four papers examine the Japanese legal framework and domestic economy institutions: economic laws in policy response to economic change; antitrust and industrial policy from the perspective of competition and cooperation; product liability rules; and problems of administrative guidance versus formal regulation. Two papers discuss how foreign exchange controls and banking laws affect access to Japan's markets and the role of property law in bilateral licensing transactions between the United States and Japan. The last three papers deal with the American legal framework and bilateral issues, discussing U.S. laws offering assistance to firms hurt by foreign competition, the Trade Expansion Act of 1962, the case study of the machine tool industry, and the television industry. Contributors are Japanese and American officials, lawyers, and economists. Saxonhouse is Professor of Economics at the University of Michigan. Yamamura is Professor of Asian Studies and Economics at the University of Washington. Index.

SNAPE, R. H., ed. *Issues in world trade policy: GATT at the Crossroads. Papers presented at a conference of the Centre of Policy Studies, Monash University, Australia*. New York: St. Martin's Press, 1986. Pp. ix, 297. \$29.95. ISBN 0-312-43724-2. JEL 87-0491

Fourteen papers, most with comments, presented at a conference on international trade problems and policies at Monash University, Melbourne, Australia. Topics considered include: War II attempts to decline of the GATT; general GATT rules; multilateral arrangements; policies of the EEC; instruments to alleviate import substitution policies; tariffs vs. import quotas; government procurement policy; and free trade zones; interplay of law and economics in international trade regulation; political economy of protection in eleven industrial countries; and trends in U.S. protection since 1930. Snape is Professor of Economics, Monash University. Index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT (UNCTAD). INTERNATIONAL TRADE CENTRE (UNCTAD/GATT (ITC)). *Handbook of state trading organizations of developing countries*. New York: United Nations, [1983] 1985. Pp. clxxxix, 542. ISBN 92-1-012014-0. JEL 87-0492

Second edition of a handbook containing a compilation of state trading organizations (STOs) of de-

veloping countries. Purpose is to serve as a tool for the promotion of their mutual business contacts and to provide information about these agencies to facilitate and extend mutual cooperation. Consists of two parts, with indexes in English, French, Spanish, and Arabic. Part one covers an alphabetical index of the STOs, technical notes, Standard International Trade Classification by section and division, products classified according to SITC codes and STOs involved in each, alphabetical glossary of products and their SITC codes, technical terms and their abbreviations, list of countries and regional groupings with corresponding ISO codes, ISO codes and regional groupings in the four languages, exchange rates for conversion from national currencies to dollars, and the four language versions of the headings of STO information sheets. Part two provides information sheets on individual STOs. Listings include alphabetical arrangement by country and details about each STO such as name, address, telephone number, date of establishment, major exports and imports and their values, and major markets and supplies. No index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT. *Operation and effects of the generalized system of preferences: Seventh and eighth reviews. Selected studies submitted to the Special Committee on Preferences at its eleventh session, Geneva, 3-11 May 1982 and at its twelfth session, Geneva, 24 April-4 May 1984.* New York: United Nations, 1985. Pp. vi, 99. \$12.50, paper. ISBN 92-1-112202-3. JEL 87-0493

Seventh and eighth general reports on the operation of the generalized system of preferences, an evaluation of its trade effects, and a discussion of the implications of future changes in the Customs Co-operation Council Nomenclature on the generalized system of preferences. The reports review changes and improvements in the system, its trade effects, its role in the context of international trade relations, and technical assistance under its auspices. The evaluation by Craig R. MacPhee estimates the trade benefits of the schemes of generalized preferences employed by the EEC and Japan for the period 1970-75. No index.

WINHAM, GILBERT R. *International trade and the Tokyo Round negotiation.* Princeton, N.J.: Princeton University Press, 1986. Pp. xiv, 449. \$45.00, cloth; \$13.50, paper. ISBN 0-691-17725-8.

JEL 87-0494

A political history of the Tokyo Round international trade negotiations of 1973-79, the seventh and largest of a postwar series of GATT multilateral negotiations. Analysis is based on personal inter-

views, government documents, and secondary sources. Begins with an introduction to the Tokyo Round, outlining the difficulties of the unfavorable trade climate in which it occurred. Describes the process of creating a collective decision-making system. Reviews the early phase and the resolution of the problem in agriculture, the middle phase and the Bonn economic summit, the end phase and the code and tariff negotiations. Discusses the internal decision-making procedures in the United States, the EEC, Japan, and Canada. Evaluates the process and its results. Concludes that things have not gone well for the world trading system since the Tokyo Round and that the greatest concern is how to maintain the liberal consensus that might promote an "open and mutually beneficial international economy into the future." Winham is Professor of Political Science at Dalhousie University, Halifax, Canada. Bibliography; index.

#### 430 INTERNATIONAL FINANCE

ALIBER, ROBERT Z. *The international money game.* Fifth edition, revised. New York: Basic Books, [1973 . . . 1979] 1987. Pp. xii, 372. \$19.95, cloth, \$9.95, paper. ISBN 0-465-03383-0, pbk.

JEL 87-0495

Fifth edition of a popular review of the international monetary system, which presents technical issues with minimal use of specialized terms. Previous editions were prepared in different economic contexts. Revisions include discussion of current issues, including the breakdown of the system of pegged exchange rates and world monetary instability. Emphasizes role of high and variable inflation and the increasing influence of Japan and Germany. Notes the close links among national financial markets and the ease with which funds are moved internationally. Discusses problems associated with floating rates and why they have been less of a panacea than projected. Credits the decline in U.S. inflation rate with contributing to greater monetary stability. Concludes that national monetary policies result from political forces within individual countries. Statistical data and illustrations have also been updated. [For annotation of the third edition, see JEL no. 79-1028.] Aliber is Professor of International Finance and Economics at the University of Chicago. Index.

BUTTEN, WILLEM H. AND MARSTON, RICHARD C., eds. *International economic policy coordination.* Paperback reprint. Cambridge: New York and Sydney: Cambridge University Press, [1985] 1986. Pp. xvi,

386. \$18.95, paper. ISBN 0-521-33780-1.

JEL 87-0496

Paperback reprint. [See JEL no. 86-0176 for annotation.]

COHEN, BENJAMIN J. *In whose interest? International banking and American foreign policy.* Council on Foreign Relations Book series. New Haven and London: Yale University Press, 1986. Pp. xi, 347. \$19.95. ISBN 0-300-03614-0. JEL 87-0497

Analyzes the impact of international banking on the American government's foreign policy capabilities and the potential for conflict between private (banking) and public (national) interests, focuses on the constraints and opportunities created by international banking for policymakers and their policy preferences. Argues for the articulation of a coherent public policy on international banking for the contemporary era. Defines international banking, examines foreign policy's increasing interdependence with the private banking sector since the 1960s, and chronicles the lending to governments found in banking history. Discusses recent situations to illustrate the potential for conflict between private and public interests, situations when foreigners had net claims on American banks (influx of Arab deposits in the 1970s and the freezing of Iranian assets during the hostage crisis), and situations when foreigners had net debts to American banks (Latin American debt and the suppression of Solidarity in Poland). Offers suggestions for dealing with bank-related issues on the current foreign policy agenda, i.e., the global debt, prudential supervision of international banking, and the management of international liquidity. Cohen is William L. Clayton Professor of International Economic Affairs, Fletcher School of Law and Diplomacy, Tufts University. Index.

EDWARDS, SEBASTIAN AND AHAMED, LIAQUAT, eds. *Economic adjustment and exchange rates in developing countries.* Chicago and London: University of Chicago Press, 1986. Pp. xi, 443. \$48.00. ISBN 0-226-18469-2. JEL 87-0498

Eleven papers and comments from a joint National Bureau of Economic Research-World Bank conference in Washington in 1984. Essays, in four sections, cover: stabilization, adjustment, and exchange rate policy in developing countries, economic reform, foreign shocks, and exchange rates, case studies of coffee in Colombia, stabilization, stagflation, and investment incentives in Kenya, 1979-80, devaluation in Greece, and the West African Monetary Union; and economic adjustment and the real exchange rate. Contributors are mainly economists. Edwards is Associate Professor

of Economics at the University of California, Los Angeles. Ahamed is a Senior Investment Officer at the World Bank. Author and subject indexes.

FASANO-FILHO, UGO. *Currency substitution and liberalization. The case of Argentina.* Aldershot, England, and Brookfield, Vt.: Gower, 1986. Pp. xi, 194. \$42.50. ISBN 0-566-05234-2.

JEL 87-0499

Argues that much of the relevance of currency substitution theory and its policy implications are still not widely recognized because most of the empirical evidence comes from developed nations. Studies the case of Argentina, which has been encouraged to shift into foreign currency because of high domestic inflation rates and ceilings on nominal interest rates. Begins with a brief background of the economy, followed by a survey of the contributions to the theory of substitutable monies. Discusses the exchange- and interest-rate policies implemented in Argentina from 1959 to 1975, the demand for local and foreign currency, and the impact on the balance of payments. Describes the stabilization-liberalization program from 1976 to 1981 and suggests reasons for its failure. The last chapter compares macroeconomic events in the Southern Cone countries (Argentina, Chile, and Uruguay) during the period when these countries were embarked in similar economic policies. Based on the author's Ph.D. dissertation at the University of Illinois at Urbana-Champaign (1984). Fasano-Filho is an economist with the Kiel Institute of World Economics.

GOLD, JOSEPH. *The 1986 Yearbook of the International Monetary Fund. Volume 3. Further studies on the articles of agreement of the International Monetary Fund.* Washington, D.C.: International Monetary Fund, 1986. Pp. 1-100. ISBN 0-939934-70-1.

Twenty-four studies (some by the Fund itself) that examine jurisprudence to which the provisions of the Articles of Agreement of the International Monetary Fund have affected the issues or been considered. Part 1 contains eight studies of new cases, the issues they raise, and their relationship to earlier cases. They concern the SDR in the courts, exchange controls, capital transfers, and par values, gold units of account and capital transfers, some American, Austrian, English, French, and Japanese cases, and the Iran-U.S. claims tribunal. Part 2 consists of thirteen studies of specific topics, they include legal concepts of public policy, capital transfers, continued effect of former par values of currencies, distinction between exchange restrictions and governmental fail-

ures to perform contractual obligations, and obligations to apply for exchange licenses. The three studies in Part 3 concentrate on the opinion of law commissions and writers concerning international monetary law and the draft Restatement of the Foreign Relations Law of the United States and Article VIII, Section 2(6) of the Fund Agreement. Gold is Senior Consultant of the IMF. Indexes to provisions of Articles of Agreement cited, resolution of Board of Governors and decisions of executive board cited, tables of authors, subjects, and summaries of principles or conclusions.

HELLEINER, GERALD K., ed. *Africa and the International Monetary Fund. Papers presented at a symposium held in Nairobi, Kenya, May 13-15, 1985*. Washington, D.C.: International Monetary Fund, 1986. Pp. xi, 277. \$10.00, paper. ISBN 0-939934-61-2. JEL 87-0501

Introductory overviews, seven papers (six commissioned) with comments and replies, and a panel discussion representing the proceedings of a symposium under the joint sponsorship for the Association of African Central Banks and the International Monetary Fund. Also contains an introduction by the editor. Part 1 consists of three overviews of Africa and the IMF. Of the seven papers, three are written from the perspective of international financial institutions and four from the perspective of African countries. They discuss: the economic crisis in Africa; the design, implementation, and adequacy of IMF programs; the performance of the international monetary system and the IMF; conditionality in the context of Africa's current social and economic conditions and disequilibria; alternative approaches to stabilization; an overview of the World Bank's evolving role in adjustment and growth; and the problems of external debt management. The topic of the panel discussion is what can be done regarding adjustment in Africa. Contributors are economists and government and agency officials. Helleiner is Professor of Economics at the University of Toronto. No index.

INTERNATIONAL MONETARY FUND. *Annual report of the executive board for the financial year ended April 30, 1986*. Washington, D.C.: Author, 1986. Pp. xi, 177. \$25.00, paper. ISSN 0250-7498

JEL 87-0502

The first section reviews developments in the world economy, discussing domestic activity and policies and international trade and payments of industrial and developing countries. The second section reports on the policies and activities of the Fund concerning the functioning of the international monetary system, surveillance, international liquidity and the SDR, the debt situation and strat-

egy, fund-supported adjustment programs, and financial policies and activities. Appendices (most of the report) consist of more detailed information about developments in international reserves and liquidity, Fund accounts in 1985/86, principal policy decisions, financial statements, and other Fund information. Index.

KOROLD, KLAUS. *Interest rate futures markets and capital market theory: Theoretical concepts and empirical evidence*. European University Institute, Series D, Economics, no. 1. New York and Berlin: de Gruyter, 1986. Pp. xvi, 321. ISBN 0-89925-178-1. JEL 87-0503

Analysis of interest rate futures markets and of their impact on individual economic agents, capital markets, and the economy. Describes futures markets and futures trading in interest-earning assets. Investigates interest rate futures markets in the context of portfolio theory. Discusses classical portfolio theory, its application to analysis of futures trading, and the effects of hedging. Assesses the applicability of the capital asset pricing model to analysis of interest rate futures markets. Outlines effect of futures trading in interest-bearing securities on the functioning of capital markets and the level and variability of interest rates. Based on the author's doctoral dissertation (1985). Bibliography; no index.

STRANGE, SUSAN. *Casino capitalism*. Oxford and New York: Blackwell, 1986. Pp. vii, 207. \$24.95. ISBN 0-631-15026-9. JEL 87-0504

Argues that mismanagement of the international financial system is the source of the major problems affecting the international political economy, i.e., debt problems of developing countries, slow growth of the world economy in the 1970s and the recession of the 1980s, instability of the banking system, uncertainty over oil prices, and precariousness of the international political situation. Discusses the evolution of the world economic disorder since 1973, emphasizing the effects of floating exchange rates, and the volatility of interest rates, the oil price, and markets in general. Surveys various proposed remedies and reform plans to bring the system under control. Concludes that the problem is a global one and proposes that the United States put its own economic management in order, both domestically and regarding management of transactions conducted in U.S. dollars in the areas of banking, developing-country indebtedness, and Western alliance defense. Strange is Professor of International Relations, London School of Economics. Bibliography; index.

ZIJLSTRA, JELLE. *Jelle Zijlstra, a central banker's view: Selected speeches and articles*. Edited by C.

GOEDHART ET AL. *Financial and Monetary Policy Studies* series, vol. 10. Dordrecht, the Netherlands: Martinus Nijhoff; distributed in the U.S. and Canada by Kluwer Academic, Hingham, Mass., 1985. Pp. x, 237. \$32.90. ISBN 90-247-3184-4. JEL 87-0505

Collection of speeches and articles delivered and published by Jelle Zijlstra in his capacity as President of the Netherlands Central Bank from 1967-1980. Contains six speeches and statements for the International Monetary Fund, the World Bank, and Bank for International Settlements meetings, five articles on aspects of international monetary reform, the banking system and EEC, international economic and monetary problems, and the world economy and the monetary system, four articles on the economic situation in the Netherlands; and four articles on general monetary reflections: inflation and its impact, a view of monetary theory and policy, "Schumpeter's Vision," and central banking. Includes a summary of Dr. Zijlstra's fourteen annual President's reports and a list of major events in the international monetary system under his presidency. No index.

#### 440 INTERNATIONAL INVESTMENT AND FOREIGN AID

CARVOUNIS, CHRIS C. *The foreign debt/national development conflict: External adjustment and internal disorder in the developing nations*. New York and London: Greenwood Press, Quorum Books, 1986. Pp. xxiii, 243. ISBN 0-89930-155-X.

JEL 87-0506

Examines the adjustment experience of indebted developing countries from August 1982 to the present. Focuses on the conflict between the payment of foreign loans and the pursuit of national development within IMF-monitored adjustment processes. Outlines the theoretical basis of the IMF's approach and overviews Fund programs and commercial debt restructurings for debt-problem economies from 1982 to 1985. Surveys factors that constrain debt-related adjustment such as general developed-country policies, demand for LDC exports, protectionism against LDC imports, developing country terms of trade, global oil demand and prices, international interest rates, and relative currency values. Investigates the recent external performance of indebted LDCs and examines present and prospective sources of external finance. Discusses principal aspects of domestic economic performance and the influence of debt-related adjustment on forms of government/electoral politics, popular reaction to adjustment, and fragmentation

within government over debt/adjustment issues. Proposes that interest capping and marginal loan guarantees represent the most direct and viable means for assisting heavily indebted developing nations. Carvounis is Associate Professor of Economics and Finance, St. John's University. Bibliography; index.

DANIEL, PHILIP AND SIMS, ROD. *Foreign investment in Papua New Guinea: Policies and practices*. Pacific Research Monograph series, no. 12. Canberra: Australian National University, National Centre for Development Studies, 1986. Pp. x, 144. Paper ISBN 0-86784-761-1. JEL 87-0507

Examines the relationship between direct foreign investment and the development strategy of Papua New Guinea. Considers available statistical data on foreign investment, the general regulatory framework faced by foreign investors, the evolution of general fiscal incentives, and comparative expectations and experience in foreign investment flows. Discusses foreign investment policy and experience in the mining, petroleum, forestry, agriculture, fishing, and manufacturing sectors. Proposes that the success of policies in mining and petroleum illustrate the importance of linking sectoral strategies for foreign investment with a clearly articulated and realistic development strategy whereas the lack of clear government objectives and policies are reflected in the less favorable experience in the other sectors. The conclusion identifies factors for establishing and conducting

policy successfully. Institute of Development Studies, University of Cambridge. Sims is First Assistant Secretary and Resources Division, Minister and Cabinet.

DAS, DEEPA K. *Migration and development in developing countries*. New York: Oxford University Press, 1986. Pp. xiv, 263. ISBN 0-19-503217-2. JEL 87-0508

Analysis of trends in the flow of various kinds of financial resources to developing countries during the postwar period. Presents a historical perspective on transnational flows of financial resources and a review of the principal source countries in the postwar period. Examines the theoretical view of the relationship between resource inflow and economic growth. Outlines trends in the growth and interaction of developing countries with the international economy. Discusses the structure and volume of bilateral flows as well as concessional economic assistance to developing countries from OPEC countries and centrally planned economies. Considers the role of the international capital market and multilateral financial

institutions as sources of financial resources for developing countries. Das is Professor at Webster College, Geneva. Bibliography; index.

ECONOMIC COMMISSION FOR LATIN AMERICA AND THE CARIBBEAN (ECLAC). *Debt, adjustment, and renegotiation in Latin America: Orthodox and alternative approaches*. Boulder, Colo.: Rienner in cooperation with the United Nations, N.Y., 1986. Pp. x, 171. \$22.00. ISBN 0-931477-72-7.

JEL 87-0509

Four essays, three published previously, examine the adjustment and renegotiation process carried out in Latin America since 1982; they also propose alternate approaches. Topics of essays are: the bargaining relationship between borrower and creditor and how a misconception of this relationship could be the source of debt problems (Robert Devlin); existing mechanisms for solving the international financial crisis and various proposals for the conversion of the outstanding debt (Martine Guerguil); stabilization and adjustment policies in the Southern Cone, 1974-83 (Joseph Ramos), and sources of recessionary bias in IMF adjustment programs in Latin America and possible policy reforms (Richard Lynn Ground). The preparers are members of ECLAC's Economic Development Division. Bibliography; index.

GORDON, SARA L. AND LEES, FRANCIS A. *Foreign multinational investment in the United States: Struggle for industrial supremacy*. New York and London: Greenwood Press, Quorum Books, 1986. Pp. xviii, 289. \$37.95. ISBN 0-89930-071-5.

JEL 87-0510

Analyzes the recent growth of foreign direct investment in the United States, focusing on its motivation, its impact on the U.S. economy, and its effects on the balance of payments and international competitiveness of domestic manufacturing. Uses steel and motor vehicles as basic illustrations. Argues for a change in trade and investment policies, including an interim period of moderate protectionism (in steel, for example) to allow for restructuring, subsidized public-sector loans, loan guarantees, investment tax credits, and a modified domestic content requirement (in automobiles). Also recommends macroeconomic policy changes such as low interest rates, stabilization of the dollar, and expansion of incentives for savings and investment. Gordon is Associate Professor of Economics and Lees is Professor of Economics and Finance at St. John's University, Jamaica, New York. Bibliography; index.

HAFER, R. W., ed. *How open is the U.S. economy?* Lexington, Mass., and Toronto: Heath, Lexington,

1986. Pp. xviii, 248. \$27.00. ISBN 0-669-13086-9. JEL 87-0511

Six papers with comments presented at the Federal Reserve Bank of St. Louis's Tenth Annual Economic Conference in October 1985. Papers explore the macroeconomic effects of increased economic integration and policy reactions to increased openness. The paper by Richard N. Cooper examines the reasons for, and effects and implications of an increasingly open U.S. economy. Jeffrey A. Frankel looks at the possibility of attributing the existence of crowding out in an open economy to imperfect integration of goods markets rather than to imperfect integration of financial markets. John Kuzsnezak and John D. Murray use sector autoregressive procedures to investigate the relationship of the domestic economy in Canada and the United States to foreign influences. Benjamin M. Friedman examines the effects and implications of the U.S. net capital inflow. The remaining two papers examine policy responses to increased openness, i.e., international interdependence and constraints on macroeconomic policies (Jacob A. Frenkel), and the dollar exchange rate and international monetary cooperation (Ronald I. McKinnon). The editor is Research Officer, Federal Reserve Bank of St. Louis. Index.

ISTITUTO ITALO-LATINO AMERICANO. *Report on the medium term prospects for Latin American countries*. Rome: Author, 1986. Pp. 109. Paper.

JEL 87-0512

A survey of the antecedents of the debt crisis, attempts at adjustment, and the outlook at the present time. Provides a framework for analysis of Latin American debt problems. Reviews key external and internal causal factors with special attention to the impact of the first oil shock on Argentina, Brazil, Chile, Columbia, Mexico, Peru, and Venezuela. Analyzes the evolution of the productive structures and external trade of these countries. Outlines the main conclusions of this analysis and the projections by international organizations and research institutions. Reviews the prospects of the seven countries and presents certain policy initiatives to deal with the debt situation. No index.

KORPORAL, GLENDA. *Yankee Dollars: Australian investment in America*. Sydney; London and Boston: Allen and Unwin, 1986. Pp. viii, 299. \$29.95. ISBN 0-86861-841-1. JEL 87-0513

Relates the story of how some of Australia's best known companies have established themselves in the United States. The product of interviews with over fifty people, mainly in 1984 and 1985, both in Australia and America and four years of reporting from the United States for the *Financial Review*.

Describes how Australia's role as host to many multinationals has changed to include that of aggressively venturing offshore by some of its largest companies. Presents a snapshot of Australian investment in the U.S. in the mid-1980s, examining the company experiences and describing the lessons learned. Finds that each company has its own story as to why it ventured abroad. Presents case studies of particular companies and industries, emphasizing differences in strategies. Korporeal is Assistant Editor of the *Financial Review*, Sydney. Index.

LOXLEY, JOHN. *Debt and disorder: External financing for development*. Boulder, Colo., and London: Westview Press in cooperation with the North-South Institute, Ottawa, 1986. Pp. xv, 228. \$24.00, paper. ISBN 0-8133-7218-6. JEL 87-0514

Analysis of the external debt and associated structural adjustment problems of third world countries. Discusses the nature and origins of economic instability in the third world and the possible domestic policies for stabilization and adjustment. Analyzes the role of transnational bank finance for expediting structural adjustment, the approaches to crisis management employed by the International Monetary Fund, and the nature of World Bank lending for structural adjustment. Investigates the trends in volume, terms, and composition of aid for dealing with economic crisis and discusses the prospects for the future. Loxley is Head of the Department of Economics at the University of Manitoba, Canada. Selected bibliography, index.

MARTON, KATHERIN. *Multinationals, technology, and industrialization. Implications and impact in third world countries*. Lexington, Mass., and Toronto: Heath, Lexington Books, 1986. Pp. xiii, 304. \$32.00. ISBN 0-669-13209-8. JEL 87-0515

Analyzes the changing roles and relationships of multinationals in third world countries, particularly as they relate to industrial and technological development in these nations. Examines the nature and impact of technology transfer through multinational companies, focusing on the growth of technological capability and the absorption and adaptation of foreign technology and know-how in the various industrial sectors. Considers the role and effects of national policies in the host countries and their impact on investments and technology transfers. Discusses technology transfers in the petroleum, mineral, and food processing industries and in pharmaceuticals, capital goods manufacture, and microelectronics and computers. Includes case studies of Brazil, India, South Korea, and Mexico. Concludes that the "experience with technology

regulation over the last decade has led to increasing awareness that strict and rigid regulation of foreign technology could result in strong disincentives for the inflow of needed foreign technology." Marton is Associate Professor of International Business and Economics at Fordham University. Index.

PONIACHEK, HARVEY A. *Direct foreign investment in the United States*. Lexington, Mass., and Toronto: Heath, Lexington, 1986. Pp. x, 256. \$28.00. ISBN 0-669-11076-0. JEL 87-0516

Examines worldwide trends in direct foreign investment and discusses motivations for investing abroad. Specific attention is directed to foreign investment in the United States, discussing the U.S. market, costs and productivity, the dollar exchange rate, inflation, and protectionism. Describes the pattern, by investor country, industry, establishment, and location, of direct foreign investment in the United States. Examines in detail institutional factors about the U.S. economy, particularly its structure, labor and industrial relations, energy situation, and banking system. Reviews the pertinent regulatory and legal framework, especially specific federal laws, commercial law, and patent, trademark, and copyright law. Examines financing considerations, describes the relevant tax laws, and discusses investment incentives and how banks can be of assistance. Ponachek is an economist with the Bank of America and adjunct Associate Professor of Economics and Finance at New York University College of Business and Economics. Index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT. *Analysis of consultancy contracts for assistance*. Sales No. E 86.II.1. 1986. Pp. xviii, 51. 104177-5

Analyzes and compares individual provisions contained in consultancy contracts in economic development projects. Focuses on engineering consultancy contracts and technical assistance agreements. Examines key provisions in consultancy contracts, such as consultant's general and personnel duties, training, and responsibilities, consultant's foreign country personnel, owner's rights and objectives, fee structures and financial provisions, payment procedures and currency-related clauses, validity of contract, settlement of dispute, and suspension, termination, and force majeure. Also available in French, Russian, and Spanish. No index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT. *Financial solidarity for development. Development assistance from OPEC members and*

*institutions to other developing countries, 1977-1983. Report by the Secretariat of UNCTAD.* New York: United Nations, 1985. Pp. xii, 180. \$17.50, paper. ISBN 92-1-112213-9. JEL 87-0518

The fourth review of financial assistance from members of OPEC to other developing nations. Identifies trends in volume, composition, sectoral orientation, and terms of concessional flows from major aid donors, national aid agencies, and contributions to multilateral institutions. Reports on developments in nonconcessional flows, trust funds, and the Venezuelan Investment Fund and discusses the nature of aid coordination. Describes the role of institutions belonging to the coordination group of Arab national and regional development finance institutions and other multilateral institutions. No index.

WEEKLY, JAMES K. AND CARY, MARY K., compilers. *Information for international marketing: An annotated guide to sources.* Bibliographies and Indexes in Economics and Economic History series, no. 3. New York and London: Greenwood Press, 1986. Pp. xi, 170. \$29.95. ISBN 0-313-25440-0.

JEL 87-0519

A listing of sources of information regarding foreign markets, marketing regulations, rules, and procedures. Geared to assist companies, organizations, and managers involved in international marketing. Refers to government publications, databases, indexes to periodicals and newspapers, and other reference sources. Organized into sections dealing with demographic, economic, market, legal, company, and methodological data, promotional and financing facilities, and political data and political risk assessments. Includes references to bibliographies, directories, indexes, dictionaries, and databases for international marketers. Appendices list a directory of publishers, state trade contacts in the United States, U.S. foreign service offices, foreign embassies in the U.S., and international marketing journals. Weekly is Professor of International Business and Cary is Assistant Professor of Library Administration at the University of Toledo. Title index.

WORLD BANK. *Recovery in the developing world: The London symposium on the World Bank's role.* Washington, D.C.: Author, 1986. Pp. vi, 122. Paper. ISBN 0-8213-0776-2. JEL 87-0520

Nine papers and the text of opening and closing remarks presented at a symposium in London in February 1985. The papers analyze current challenges to the international donor community; the impact of the debt crisis on middle income and poor countries; the current role of the World Bank; the Bank's role in a maturing capital market; its

impact on economic policy in developing countries; its opportunities and limitations in promoting the private sector; the viability of "redistribution with growth"; the Bank's policies and operations in the future; and development priorities for sub-Saharan Africa. The contributors are: Mike Faber, Timothy Raison, Nicholas Hope, Stuart Holland, Michael Beenstock, S. Shahid Husain, John Toye, E. A. Brett, D. Joseph Wood, and Stanley Please and are mainly economists and World Bank officials. Bibliography; no index.

## 500 Administration; Business Finance; Marketing; Accounting

### 510 ADMINISTRATION

KAYNAK, ERDENER. *Marketing and economic development.* New York and London: Greenwood Press, Praeger, 1986. Pp. xxii, 200. \$37.95. ISBN 0-275-90003-7. JEL 87-0521

Explores the relationship between marketing and economic development, focusing on the development process and the general features of marketing activity in different economic settings. Examines the possibility of marketing technology transfer from the West to the LDCs; how marketing technology can help attain development goals, marketing strategy for development; and contributions of research at both the micro and macro levels. Cites examples from socialist countries, newly industrialized nations, Latin America, Europe, China, and Japan, among others. Kaynak is Professor of Marketing, Pennsylvania State University, Harrisburg. Selected bibliography; index.

### 520 BUSINESS FINANCE AND INVESTMENT

AMJAD, RASHID. *Private industrial investment in Pakistan, 1960-1970.* Cambridge South Asian Studies series. Cambridge; New York and Sydney: Cambridge University Press, 1982. Pp. xv, 257. £ 25.00. ISBN 0-521-23261-9. JEL 87-0522

Analyzes the factors that induced the growth and pattern of industrial investment in the 1960s in Pakistan with reference to the large-scale manufacturing sector, emphasizing the importance of institutional and supply factors, especially foreign aid, in explaining industrial investment. Develops a simple model of investment behavior to test the nature of the relationship between investment and institutional arrangements, level of profitability, expansion of the market, and foreign aid dispersed as loans. Examines: the corporate environment and its major actors (monopoly houses, the government, and financial institutions); the factors that

influenced profitability in this environment, i.e., government measures as well as market structure and links between industrial and trading interests; and the factors influencing investment behavior at the firm level, of monopoly houses, and at the industry level. Concludes that the success story of the early 1960s and subsequent slowing down and stagnation of the later 1960s can best be explained when the economic system is considered as a foreign-aid-dependent regime, when aid flows slowed down the earlier growth could not be sustained. Bibliography; index.

EDWARDS, JEREMY, ET AL., eds. *Recent developments in corporate finance*. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xiv, 240. \$34.50. ISBN 0-521-32964-7.

JEL 87-0523

Contains eight papers from the proceedings of the Economic and Social Research Council/Centre for Economic Policy Research conference on "Recent Developments in Corporate Finance, Investment and Taxation" at Wadham College, Oxford, and the Institute of Economics and Statistics, Oxford, in 1985. Papers reflect a diverse range of developments in financial economics. Two themes recur—the imperfections in financial markets and the role of taxation in influencing the behavior of companies and investors. Essays are grouped under four headings—financial markets, issues in corporate finance, banking, and international finance. Specific papers deal with the efficiency of financial markets, precommitment to equity financing choices with asymmetric information, equity issues and offering dilution, effects of asymmetric taxation on corporate investment, credit rationing and collateral, competitive banking, taxation of foreign direct investment income, costs to crossborder investment and international equity market equilibrium. The contributors are mainly economists. Coeditors are Julian Franks, Colin Mayer, and Stephen Schaefer. Edwards is at St. John's College, Cambridge University. No index.

### 530 MARKETING

DICKINSON, JOHN R. *The bibliography of marketing research methods*. Lexington, Mass., and Toronto: Heath, Lexington Books, 1986. Pp. xxvi, 788. \$49.95. ISBN 0-669-12373-0. JEL 87-0524

Bibliography of references to publications cited in marketing and marketing research periodicals, conference proceedings, textbooks, and handbooks. Contains over 9,200 entries organized under some 800 headings and subheadings in three parts: marketing research function, data collection

methods, and data analysis techniques. Within each heading or subheading, entries are listed alphabetically. Dickinson is at the University of Windsor. Author and subject indexes.

See also: Book Numbers JEL 87-0519, 87-0553

## 600 Industrial Organization; Technological Change; Industry Studies

### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

ADAMS, WALTER AND BROCK, JAMES W. *The bigness complex: Industry, labor, and government in the American economy*. New York: Pantheon Books, 1986. Pp. xiii, 426. \$22.95. ISBN 0-394-54721-7.

JEL 87-0525

Analyzes the anatomy of the "bigness complex" in its diverse forms, examining the "quintessential myth of America's corporate culture that industrial giantism is the handmaiden of economic efficiency and consumer welfare." Begins with an examination of power and public policy, pointing to the numerous current economic problems. Examines the "popular mythology" about the benefits of corporate giantism, especially in connection with efficiencies of operation and innovation and social efficiency. Presents a historical perspective on the political economy of power, followed by an analysis of the market as a social control mechanism, with emphasis on antitrust policy, arguing decentralized management of power, and military-industrial policy alternatives. power and its attendant disproportionate influence. University Professor, State University of Brock, Economics at Miami University of Ohio. Author and subject indexes.

AGAR, MICHAEL H. *Independents declared: The dilemmas of independent trucking*. Smithsonian Series in Ethnographic Inquiry, vol. 4. Washington, D.C. and London: Smithsonian Institution Press, 1986. Pp. 191. \$24.95, cloth, \$14.95, paper. ISBN 0-87474-250-1. JEL 87-0526

Based on interviews, field observation, research into regulatory history of trucking, and analysis of the trucker's image in popular novels and films. Views trucking as a complicated field, emphasizing the dependence of the independent trucker on shippers, bankers, insurance companies, and regulators. Examines the truckers' actual working world from the point of view of those who work in it, focusing on the contradiction between in-

dependence and control. Topics include: road life, leasing, loads, rates, carrier operations and manipulations, state regulations, repairs, mechanical problems, breakdowns, and deregulation. Concludes that dependency is the most salient feature of the industry. Agar is a Professor of Anthropology at the University of Maryland. Index.

AHARONI, YAIR. *The evolution and management of state owned enterprises*. Ballinger Series in Business and Public Policy. Cambridge, Mass.: Harper and Row, Ballinger, 1986. Pp. xiv, 475. \$29.95. ISBN 0-88730-164-9. JEL 87-0527

Investigates the structure, operations, performance, conduct, goals, control issues, and management problems of state-owned enterprises. Reviews the origins of state-owned enterprises. Examines issues such as the role of management, the establishment of management standards, the determination of criteria of performance, the relationships with the private sector, their scope of operations, their control by the state, their pricing and profit policies, and their adaptation to institutional factors. Also describes the relationships of state-owned enterprises with private investors, comments on privatization as an alternative, and reviews the international implications of state-owned enterprises. Concludes with a contingency model of state-owned enterprise behavior. Aharoni is at Tel-Aviv University. Bibliography; author and subject indexes.

AYUB, MAHMOOD ALI AND HEGSTAD, SVEN OLAF. *Public industrial enterprises: Determinants of performance*. Industry and Finance Series, vol. 17. Washington, D.C.: World Bank, 1986. Pp. xi, 77. \$5.00, paper. ISBN 0-8213-0615-7. JEL 87-0528

Study identifying the factors influencing the performance of public industrial enterprises. Reviews data on public enterprises in thirteen countries and isolates three basic factors that distinguish public enterprises that perform successfully. Discusses the importance of a competitive environment as a determinant of performance. Reviews the impact of varying degrees of financial and managerial autonomy and accountability, managerial skills and morale, and coordination within the government. Annexes contain a review of origins of public industrial enterprises, their management and board of directors, and of the use of holding companies. Ayub is Senior Industry Economist and Hegstad is Senior Industry Specialist, both in the Industry Department of the World Bank. No index.

DiMAGGIO, PAUL J. *Nonprofit enterprise in the Arts: Studies in mission and constraint*. Yale Studies on Nonprofit Organizations series. New York and Ox-

ford: Oxford University Press, 1986. Pp. xv, 370. \$39.95. ISBN 0-19-504063-5. JEL 87-0529

Examines the production and distribution of art in the United States. Sixteen interdisciplinary essays, several published previously, provide perspectives on issues such as financing nonprofit art organizations, the relationship between industrial organization and social purposes in the arts, and constraints on funding activities. Papers in Part 1 explore the reasons why arts organizations are nonprofit. Those in part 2 discuss the sources of nonprofit cultural organizations revenues. The papers in part 3 examine factors influencing the mission of arts organizations. Part 4 deals with nonprofit enterprise in for-profit cultural industries such as television and publishing. European perspectives are also presented. DiMaggio is an Associate Professor of Sociology at Yale University. Index.

[DORSEY, JASPER N. AND WIGGINS, BEN T.] *Telecommunications in the post-divestiture era: Essays in honor of Jasper N. Dorsey and Ben T. Wiggins*. Edited by ALBERT L. DANIELSEN AND DAVID R. KAMERSCHEN. Lexington, Mass., and Toronto: Heath, Lexington Books, 1986. Pp. xiv, 252. \$25.00. ISBN 0-669-13445-7. JEL 87-0530

Twenty-one essays in honor of Jasper Dorsey, retired Vice-President and Chief Executive Officer of Georgia Operations (Southern Bell) and Ben T. Wiggins, an attorney and former public service commissioner in Georgia. Purpose is to promote an exchange of ideas among those involved in the telecommunications industry. The papers in Part 1 focus on state regulation and the decision making process at the level from the perspective of the regulator. The essays in Part 2 present telecommunications issues from the standpoint of the companies, who deal with them on a day-to-day basis. The theme of the papers in Part 3 is pricing in an asymmetrically regulated market. Those in part 4 deal with nontelecommunications issues such as market power, interchange, depreciation reserves, and modeling of economic impacts. The contributors are mainly industry executives and economists. Danielson is Professor of Economics and Kamerschen is Distinguished Professor and holder of the Chair of Public Utilities in the Department of Economics, both at the University of Georgia. Index.

EPSTEIN, EDWARD JAY. *Who owns the corporation? Management vs. shareholders*. Twentieth Century Fund Paper series. New York: Priority Press, 1986. Pp. vi, 69. \$8.00, paper. ISBN 0-87078-208-8. JEL 87-0531

Describes the current waves of corporate mergers and acquisitions by corporate "raiders." Ana-

lyzes the "myth of corporate democracy," reviewing how the earlier debate over participation by shareholders in corporate affairs has been rendered somewhat meaningless by the current no-holds-barred contests. Examines management defenses designed to thwart raiders. Expresses concern that continued dispersion of ownership will result in transfer of control from legal owners to management groups. Suggested remedies include: making tender offers equally available to all shareholders; ending two-tier tender offers; and forcing management to submit all bona fide tender offers to a shareholder vote before activating anti-takeover measures. Epstein is a free lance journalist. No index.

FINSINGER, JÖRG AND PAULY, MARK V., eds. *The economics of insurance regulation: A cross-national study*. New York: St. Martin's Press, 1986. Pp. xi, 300. \$35.00. ISBN 0-312-23445-7.

JEL 87-0532

Ten essays on the conduct and performance of insurance markets, especially automobile and life insurance, in seven countries. Studies begin with a description of market characteristics and regulatory institutions, followed by an in-depth analysis of regulatory instruments and their market impacts in Great Britain and the United States and the centrally controlled market in West Germany. Also examines regulation in Sweden, Switzerland, France, and Canada. Contributors are economists, and finance, insurance, and regulation specialists. Finsinger is Professor of Economics at the Hochschule Lüneburg and Wissenschaftszentrum, Berlin. Pauly is Robert D. Eilers Professor of Health Care Management and Economics at the Wharton School and Professor of Public Management and Economics at the University of Pennsylvania. Index.

GILLEN, DAVID W., OUM, TAE HOON AND TRETHEWAY, MICHAEL W. *Airline cost and performance: Implications for public and industry policies*. Vancouver: University of British Columbia, Centre for Transportation Studies, 1985. Pp. 170. ISBN 0-919804-39-X.

JEL 87-0533

Study of the Canadian airline industry and its regulatory environment. Provides a methodology for assessing the performance of the industry at a time of debate regarding the direction of air transport policy. Also contributes a method for examining multi-product firms and their cost structure. Describes the evolution of regulatory policy in Canada and the institutional setting of the industry and discusses previous theoretical and empirical studies. Examines outputs, inputs, and characteristics of class I and II air carriers for the period

1964-81. Analyzes productivity and assesses the productivity consequences of managerial decisions and regulatory constraints; includes discussion of the results and comparisons over time and across firms. Presents cost models, including measures of economies of scale and density. Concludes that performance comparisons based simply on total factor productivity and cost measures indicate that the trunk carriers have been more productive than the regional ones. However, after correcting these measures for scale and density economists and inter-carrier differences in the operating environment, the relationship changes so that there are no significant differences in carrier performance after controlling for differences in traffic density and available capital. Gillen is a faculty member in the School of Business and Economics at Wilfrid Laurier University. Oum and Tretheway both are on the Faculty of Commerce and Business Administration at the University of British Columbia. Bibliography, no index.

HALL, RICHARD H. *Organizations. Structures, processes, and outcomes*. Fourth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1972 . . . 1982] 1987. Pp. x, 358. ISBN 0-13-642018-4.

JEL 87-0534

Fourth edition of a textbook on organizations now with the word "outcome" added to the title. Emphasizes the sociological roots of the book although references are to psychology, political science, and management. Divided into four parts: organizations, development of organizations, individuals, communities, and the nature and types of organizations: public and voluntary ones. Part 1: organization and structure. Part 2: organizational processes, including decision making. Part 3: organizational development. Part 4 examines organizational behavior, particularly the perception of behavior and its impact on organizations and interorganizational relationships. The concluding part deals with organizational effectiveness and theory, presenting a variety of models such as population-ecology, resource dependence, rational choice, Marxist or class, and institutional. Hall is a faculty member in the Department of Sociology at the State University of New York at Albany. Name and subject indexes.

MAGAT, WESLEY A., KRUPNICK, ALAN J. AND HARRINGTON, WINSTON. *Rules in the making: A statistical analysis of regulatory agency behavior*. Washington, D.C.: Resources for the Future, 1986. Pp.

xiii, 182. \$22.50. ISBN 0-915707-24-1.

JEL 87-0535

Applies statistical techniques to explain how decisions are made by regulatory agencies, using as a representative example the industrial effluent standards set by the Environmental Protection Agency (EPA) pursuant to the Federal Water Pollution Control Amendments of 1972. Purpose is to develop an improved methodology for exploring how social regulatory agencies issue their rules and then to derive implicit decision rules from a large number of actual agency decisions. Describes how agencies make rules, focusing on their informal rulemaking processes to establish technical rules and comparing five examples of rulemaking. Reviews the literature relevant to understanding regulatory decision making and develops a formal model of the standard-setting process. Also discusses the methodological issues faced in developing suitable data. Uses regression analysis and other quantitative data to test hypotheses explaining how EPA sets its effluent guidelines. Concludes with an analysis of applying the revealed preference approach to understanding how agencies make rules. Magat is an Associate Professor with the Schools of Business and Public Policy at Duke University. Krupnick and Harrington are Fellows with Resources for the Future. Index.

MOORHOUSE, JOHN C., ed. *Electric power: Deregulation and the public interest*. Foreword by HAROLD DEMSETZ. Pacific Studies in Public Policy series. San Francisco: Pacific Research Institute for Public Policy, 1986. Pp. xviii, 516. \$34.95, cloth; \$14.95, paper. ISBN 0-936488-02-6, pbk. JEL 87-0536

Fifteen essays deal with the uncertain future of the electric power industry. Papers cover a wide range of topics such as electric utility regulation, competition in the production of electricity, tax policy and utility regulation, inflation and regulation, environmental regulation of electric utilities, electric utility regulation in an open economy, politicization of the electric utility industry, the demand for regulation, efficiency and cross subsidy in electric utility pricing, performance of utility commissions, information and incentives, property rights in utility franchises, and perspectives on reform in electric utility regulation. Major theme is that replacing market competition with government decrees "as the main institutional device for assuring good performance" has proved unwise. The contributors are mainly economists. Moorhouse is a Professor of Economics at Wake Forest University. Index.

SAGERS, MATTHEW J. AND GREEN, MILFORD B. *The transportation of Soviet energy resources*. Totowa,

N.J.: Littlefield, Adams; Rowman and Littlefield, 1986. Pp. xvi, 177. \$32.50. ISBN 0-8476-7504-1.

JEL 87-0537

Monograph analyzing the efficient transportation of energy in its major forms (oil, coal, natural gas, and electricity) from sites of production to those of consumption in the Soviet Union. Focuses on the general pattern of flow within each energy transportation system and upon identifying major impediments to efficient flows and other transport problems. Models each energy transportation system as it existed in 1980 as an abstract capacitated network; applies a network allocation model (the out-of-kilter algorithm) to each abstracted system to determine optimal flows and associated costs and compares the model's pattern of optimal flows with what is known of actual flows. Concludes that, in general, the models justify post-1980 developments in each energy transportation system. Also contains an epilogue on the impact of Chernobyl. Sagers is an economist for the Soviet Economics Studies Branch, Center for International Research, Bureau of the Census, Washington, D.C. Green is Associate Professor of Geography, University of Western Ontario. Terms, authors, and places indexes.

SINGLETON, ROSS C. *Industrial organization and antitrust: A survey of alternative perspectives*. Columbus, Ohio: Publishing Horizons, 1986. Pp. ix, 102. Paper. ISBN 0-942280-15-6. JEL 87-0538

Designed as a primary or supplementary introductory textbook to be used in industrial organization theory, antitrust law, and government and business courses. Presents fundamental theoretical and empirical differences of opinion within the field of industrial organization regarding the economic and political consequences of industrial concentration and the proper role of antitrust enforcement. Describes the traditional Mason-Bain-Scherer and recent developments within the tradition: the structuralist school; the Chicago school, the Austrian school; and perspectives of Joseph A. Schumpeter, John Kenneth Galbraith, Oliver E. Williamson, and Richard A. Posner. The concluding chapter summarizes the book, discusses the rebirth of the potential competition doctrine, and presents a view of the economic significance of collusion. Chapters contain review questions and listings of representative readings. Selected antitrust cases are developed only as they pertain to monopoly, merger, and restraint provisions of the law. Singleton is at the University of Puget Sound, Tacoma, Washington. Subject, case, and author indexes.

SNOW, MARCELLUS S. *Marketplace for telecommunications: Regulation and deregulation in industrial-*

*ized democracies.* University of Pennsylvania, Annenberg School of Communications series. New York and London: Longman, 1986. Pp. xvi, 304. \$34.95. ISBN 0-582-28600-X. JEL 87-0539

Twelve essays present a cross-country comparison of the economic and political facets of telecommunications regulations, describing their economic, political, legal, and institutional aspects. Case studies include Australia, Canada, France, West Germany, Japan, the United States, and the United Kingdom. Analyzes the historical forces responsible for regulation. Focuses on recent trends toward deregulation, privatization, and demopolization. The contributors are mainly economists. Snow is Associate Professor of Economics at the University of Hawaii at Manoa. Index.

UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE. *Recent trends in flexible manufacturing*. New York: United Nations, 1986. Pp. xv, 314. \$33.00, paper. ISBN 92-1-116347-1

JEL 87-0540

One of a series of studies dealing with industrial automation. Presents the background, emphasizing the distinction between mechanization and automation. Examines the state of the art of flexible manufacturing systems. Attributes a new phase or shift in manufacturing technology some thirty years ago to two innovations—the digital computer and the integrated circuit and microcomputer. Reviews the implications of computerized manufacturing technology. Describes the nature of a flexible manufacturing system; quantitative and qualitative aspects of flexible manufacturing, problems and prerequisites for the planning, implementation, and operation of a flexible manufacturing system, the role of governments in promoting such systems, and policy recommendations. No index.

See also: Book Numbers JEL 87-0373, 87-0392, 87-0457, 87-0470, 87-0472, 87-0490, 87-0543

## 620 ECONOMICS OF TECHNOLOGICAL CHANGE

BAARK, ERIK AND JAMISON, ANDREW, eds. *Technological development in China, India and Japan: Cross-cultural perspectives*. New York: St. Martin's Press, 1986. Pp. xii, 264. \$32.50. ISBN 0-312-78794-4. JEL 87-0541

Six papers present a comparative analysis of technological change in large Asian countries. Baark and Jamison review the nature of the relationship between technology and culture. Per Sörblom presents a historical review of the reception of Western technology in China and Japan. Jon Sigurdson studies the policy responses in Japan and Sweden to the challenge of the fast pace of change in high technology. Baark examines the nature of informa-

tion infrastructures in India and China. Ron Matthews discusses the case of machine-tool manufacture for a comparative analysis of technological dynamism in India and Japan. Aant Elzinga and Jamison present a cultural critique of technology in India and Japan. The contributors are mainly specialists in the history and theory of science and technology. The editors are Research Fellows at the Research Policy Institute, University of Lund, Sweden. Index.

DANZIGER, JAMES N. AND KRAEMER, KENNETH L. *People and computers: The impacts of computing on end users in organizations.* CORPS (Computing, Organizations, Policy, and Society) Series. New York: Columbia University Press, 1986. Pp. xv, 268. \$32.50. ISBN 0-231-06178-1.

JEL 87-0542

An empirical assessment of the positive and negative impacts of computing on its end users. Examines the level and types of use of computing among managers, staff professionals, street-level bureaucrats, and desk-top bureaucrats. Analyzes the performance benefits from computing and certain problems associated with its use. Discusses the effect of computing on the work environment and on the extent of control exercised by workers and managers. Attempts to identify the sources of the differential impacts of computing and outlines the characteristics of successful end-user computing. Danziger is Research Scientist and Kraemer is Director in the Public Policy Unit, University of Calif.

KORAIL, VALENTINE. *Patent law regulation rules regulation*. Law Monographs. ESC, 1986. Pp. xv, 100. \$14.95. ISBN 0-906214-45-9

A commentary on the Commission's 1984 paragraph, dealing with the regulation of patent licenses. Begins by considering whether collaboration in R&D should be exempted or cleared. Reviews the views of the commission on granting exemptions, citing cases to present these views. Examines inherent anticompetitive effects and ancillary restrictions of joint ventures. Cites the Community courts' views and the Commission reactions. Presents details about group exemptions, the scope and conditions for application of the regulation, exemptions of restrictions of competition, obligations not infringing on the regulations, and opposition procedures. Concludes with a discussion of the kinds of agreements to which the exemption is or is not likely to apply, strategy to prevent commercial loss, and disadvantages of notification. Indicates that what is important is the growing

tendency for the Court and Commission to look more realistically at the market before finding that competition is restricted. Korah is Professor of Competition Law at University College, London. Includes lists of cases, secondary legislation, and principal banks and articles. No index.

WOODS, STANLEY. *Western Europe: Technology and the future*. Atlantic Paper series, no. 63. London, Sydney and Wolfeboro, N.H.: Croom Helm for the Atlantic Institute for International Affairs, 1987. Pp. viii, 106. Paper. ISBN 0-7099-5220-1.

JEL 87-0544

Explores the impact of technological development on the structure of industrial democracies and the problems for public policy. Contends that Western Europe has been less successful than the United States and Japan in the high technology industrial sector, resulting in a deterioration of its competitive position. Examines why the notion of a technology gap has developed in Europe, assesses the economic consequences of such a gap, evaluates statistical data dealing with conclusions about the gap, identifies factors affecting weak innovation performance in Western Europe, and examines policies designed to cope with the foregoing areas. Assesses comparative Western European, Japanese, and American performances, with microelectronics as a case study. Places part of the blame for the gap on limited relations between academe and industry, excessive reliance on a few large firms protected by government, and market rigidities. Woods is a Research Associate at the Atlantic Institute for International Affairs, Paris. No index.

### 630 INDUSTRY STUDIES

BARNETT, DONALD F. AND CRANDALL, ROBERT W. *Up from the ashes: The rise of the steel minimill in the United States*. Washington, D.C.: Brookings Institution, 1986. Pp. xii, 135. \$26.95, cloth; \$9.95, paper. ISBN 0-8157-0634-3. JEL 87-0545

Documents the growth of minimills, comparing their economic performance with that of the larger, fully integrated steel companies. Finds that the minimills increasingly are moving out more sophisticated product lines, taking markets away from both the bigger domestic firms and importers. Shows that some of the minimills have costs as low as producers anywhere else in the world and may arrest the rising trend of import penetration, though they are currently unable to produce all the higher grades of steel. Uses the experience of

approximately forty mills to demonstrate how entrepreneurial effort can succeed in developing profitable businesses. Attributes the success of minimills to factor prices, innovation, and product quality. Examines the lessons for national policy that can be learned from the steel experience. Suggests that policymakers should pay as much attention to the strategies of these newer companies as to the dilemmas of the older steel companies. Barnett is an associated staff member of the Economic Studies Program at the Brookings Institution and a consultant at the World Bank. Crandall is a Senior Fellow in the Economic Studies Program at the Brookings Institution. Index.

DEMAC, DONNA A., ed. *Tracing new orbits: Cooperation and competition in global satellite development*. Columbia Studies in Business, Government, and Society series. New York: Columbia University Press, 1986. Pp. xviii, 329. \$35.00. ISBN 0-231-06344-X. JEL 87-0546

Eighteen papers, many drawn from a conference on international satellite programs at Columbia University. Papers examine issues related to the achievement of stable, peaceful, and equitable satellite communications among developed and developing countries and public, private, national, and regional carriers in the context of international cooperation and competition. Two papers consider satellite activity challenges in the 1980s based on international space treaties and the common heritage principle and the competition between satellites and fiber optics. Four papers discuss the emergence of specialized and regional satellite systems and the present challenges to INTELSAT. Six papers overview satellite developments in Western Europe, Canada and the United States. Four papers examine the issue of equitable access with special reference to the regulatory activity of the International Telecommunication Union of the U.N. The last two papers look at Soviet satellite communications. The contributors are mainly economists, communications specialists, and legal and international affairs experts. The editor is an attorney, writer, and educator living in New York City. Selected bibliography; index.

EL MALLAKH, RAGAFI, ed. *The Middle East, Pacific Basin, and the United States: Refining and petrochemicals: Proceedings of the Sixth International Area Conference*. Boulder, Colo.: International Research Center for Energy and Economic Development, 1986. Pp. xii, 180. \$36.00, paper. ISBN 0-918714-10-9. JEL 87-0547

Eighteen papers presented at a conference in October 1985. Includes topics such as the changing petroleum products market; the world surplus of

refining capacity; Middle East economic cooperation; trade east of Suez; the international petrochemical trade; the Venezuelan petrochemical industry; restructuring in the industry; the Saudi Arabia case; the industry in the Arab countries, the industry in Egypt, China, and Japan; energy production and consumption in the Yemen; future energy trends; and the oil price future. The contributors are economists, government and industry representatives, and energy specialists. El Mallakh is Director of the International Research Center for Energy and Economic Development and Professor of Economics at the University of Colorado. No index.

FAULHABER, GERALD; NOAM, ELI AND TASLEY, ROBERTA, eds. *Services in transition: The impact of information technology on the service sector*. Cambridge, Mass.: Harper and Row, Ballinger, 1986. Pp. xix, 218. \$29.95 ISBN 0-88730-092-8.

JEL 87-0548

Eight essays, most with discussions, explore the role of information technology in improving service sector productivity. Papers represent the proceedings of a conference on the Impact of Information Technology on the Service Sector at the Wharton School, University of Pennsylvania, sponsored by the United States Census Bureau and the National Science Foundation. Topics include: trends in the service sector and information technology, information technology and the health care industry in the United States, impact on the insurance industry structure, technology and financial services, the impact of information technology on trade in services, the influence of information technology on the U.S. economy; demographics and the retail response, and the information feedback process. The contributors are mainly economists, public policy specialists, and management experts. Faulhaber is Associate Professor in the Department of Public Policy and Management, the Wharton School, University of Pennsylvania. Noam is Associate Professor at the Graduate School of Business, Columbia University. Tasley is Executive Director of the Center for Telecommunications and Information Studies at Columbia University. Author and subject indexes.

FRANSMAN, MARTIN, ed. *Machinery and economic development*. New York: St. Martin's Press, 1986. Pp. xvii, 274. \$35.00. ISBN 0-312-50222-2.

JEL 87-0549

Seven essays examine the role of the machinery sector in generating and diffusing technical change. Throws light on questions such as whether a nation must develop its own machinery sector or whether it can rely on imports and what are the problems

that newly industrialized nations have faced in promoting this sector. The first contribution discusses the role of machinery in economic development, analyzing how resources should be allocated among capital, consumption, and export goods. The second essay describes how well developing countries have fared in the attempt to spur indigenous capital goods sectors, using Brazil, India, and South Korea as case studies. The next paper discusses questions of design capabilities, with a detailed case study of firms in the general machinery industry in South Korea. Four case studies follow—a history of the machine tool industry (Japan), international competitiveness and diffusion and the role of the estate (Taiwan and Japan), the capital goods industry and the dynamics of development in LDCs (Brazil) and the role of the capital goods industry in crisis and recovery (Mexico). The contributors are: Fransman, Daniel Chudnovsky, Alice H. Amsden, Linsu Kim, Toshiaki Chokki, Fabio Stefano Erber, and Ajit Singh. Fransman is Lecturer in Economics at the University of Edinburgh. Index.

GEMMELL, NORMAN. *Structural change and economic development. The role of the service sector*. New York: St. Martin's Press, 1986. Pp. xii, 216. \$32.50. ISBN 0-312-76669-6. JEL 87-0550

Examines aspects of the process of structural change during development and the role of service activities in that process. Examines patterns of structural change during development, market and nonmarket sectors, models of structural change, and an integrated insurance tax, a voluntary cash transfers to case study evidence developed countries to including a detailed structural changes, development growth, and the Gemmell is a Lecturer in Economics at the University of Durham. Author and subject indexes

JOWETT, PAUL AND ROTHWELL, MARGARET. *The economics of information technology*. New York: St. Martin's Press, 1986. Pp. xiv, 108. \$29.95. ISBN 0-312-23434-1. JEL 87-0551

Analyzes the development of information technology at both the micro- and macroeconomic levels. At the micro level, focuses attention on individual firms, universities, and research laboratories in the United States, Britain, Japan, and Europe. At the macro level, investigates and compares national efforts and the role of the respective governments in stimulating them. Objective is to identify the principal economic determinants of success for companies and countries in the field. After present-

ing a background briefly describing the development of the industry, separate chapters are devoted to the experiences of Japan, the United States, Europe, and Britain. Notes that the Japanese have relied mainly on government stimulus for information technology development, in contrast to greater reliance on the private sector in the other nations. Jowett is a Research Associate of Templeton College, Oxford University. Rothwell is a Lecturer in Economics at Oxford Polytechnic. Bibliography; index.

- MAHMOUDOV, ALEXEI. *The Soviet oil and natural gas industries (Problems of reserve estimation)*. Monograph Series on Soviet Union. Falls Church, Va.: Delphic Associates, 1986. Pp. vii, 95. Paper.

JEL 87-0552

Analysis of the Soviet oil and natural gas industries since World War II. Presents a historical background to the current energy problems. Reviews the geological nature of oil and gas deposits in West Siberia and the Caspian Sea region and certain problems in the oil and natural gas industries in these areas. Describes the organizational structure of Soviet geological and oil and gas extracting institutions and certain special features of Soviet oil and gas reserve estimation. No index.

- PELLEGRINI, LUCA AND REDDY, SRINIVAS K. *Marketing channels: Relationships and performance*. Advances in Retailing Series. Lexington, Mass., and Toronto: Heath, Lexington, 1986. Pp. xiii, 209. \$29.00. ISBN 0-669-13158-X. JEL 87-0553

Contains eleven of the papers presented at the Third International Conference on Distribution held at Angera, Italy, in April 1985, sponsored by the Centro di Studi Sul Commercio (CESCOM) of the University of Bocconi (Milan) and the Institute of Retail Management (IRM) of New York University. Essays address the issues involved in managing distribution relationships and marketing channels. Four papers deal with vertical agreements, comparing the efficiency of two-part tariff agreements, resale price maintenance and antitrust policy, economic effects of exclusive purchasing arrangements, and sale or return agreements versus outright sales. The second part, also four essays, deals with diverse aspects of the issues in coordinating marketing channels of distribution, such as the effects of interorganizational relationships, relationship management of distributors, the distribution choices made by the press industry and their competitive effects, and the problem of counterfeit products. The last section, of three essays, deals with location strategy and forecasting demand, discussing shopping behavior and optimal store locations, the impact of change on retail images, and

increasing the efficiency of forecasting seasonal demand for individual products. Pellegrini is the Deputy Director of the Centre for Retail Studies, Bocconi University, Milan. Reddy is an Assistant Professor of Marketing at New York University. Index.

- SALTZMAN, SIDNEY AND SCHULER, RICHARD E., eds. *The future of electrical energy: A regional perspective of an industry in transition*. New York and London: Greenwood Press, Praeger, 1986. Pp. xviii, 372. \$47.95. ISBN 0-275-92158-1.

JEL 87-0554

Twenty-seven papers presented at a conference entitled "New York's Electrical Future" held in November 1984 in New York City. Part 1 reviews the history of electricity in the city, the energy crisis, and the long-run security of the energy supply. Part 2 estimates regional economic activity, electricity demand, and prices in the future. Part 3 evaluates alternative electricity supply plans and the role of evolving technologies. Part 4 considers environmental and health effects of electric power generation and use. Part 5 discusses public perceptions of the electric utility industry. Part 6 deals with the financial environment surrounding electric utilities in New York State. Part 7 assesses the institutional and regulatory constraints facing the electrical industry and the prospects for reform. The contributors are energy specialists. Saltzman is Professor of City and Regional Planning and Schuler is Professor of Economics and of Civil and Environmental Engineering, both at Cornell University. Index.

- SAUVANT, KARL P. *International transactions in services: The politics of transborder data flows*. Atwater Series on the World Information Economy, no. 1. Boulder, Colo., and London: Westview Press, 1986. Pp. xxiii, 372. \$38.50, paper. ISBN 0-8133-0310-9. JEL 87-0555

Documents the emergence of the data industries and especially data-service industries; analyzes the economic impact of transborder data flows; reviews the politics of related issues and the debate regarding international transactions in services; and examines bilateral, regional, and international developments affecting the establishment of an international public policy framework for services. Examines trade and foreign direct investment in services; the impact of data services on existing industries, international economic transactions, international division of labor, and foreign direct investment; protection of privacy issues, U.S. policy, and competing values and approaches. Highlights aspects of the bilateral, regional, and international policy discussions, e.g., United States-Israel Free

Trade Agreement, U.S.-Canada negotiations, and the OECD declaration on transborder data flows, as well as work done by the Intergovernmental Bureau for Informatics and the Latin American Economic System. Concludes with a discussion of the national and international implications of an international regime for trade and foreign direct investment in data services. Sauvant is affiliated with the United Nations Centre on Transnational Corporations. No index.

SHAUER, BRUCE P. *The economics of managing library service*. Drawings by NOLAN ANDERSON. Chicago and London: American Library Association, 1986. Pp. xii, 278. \$49.00. ISBN 0-8389-3453-X. JEL 87-0556

Uses tools of microeconomics to assist library administrators in resolving problems associated with resource allocation. Cites many examples of trade-off decisions where economic analysis is helpful, particularly in connection with theories of consumer behavior and production decisions. Extends microeconomic analysis by using tools of operations research, cost-benefit analysis, statistics, mathematics, and quantitative decision models. Places the library in the context of traditional demand and supply analysis, using information as the product. Also reviews the economic rationale for public funding of libraries as well as the use of fees to finance library services. Schauer is Head Librarian of the Fairwood Library in Renton, Washington. References at end of each unit. Index.

EVENS, PAUL, ed. *International gas: Prospects and trends*. New York: St. Martin's Press, 1986. Pp. 144. \$35.00. ISBN 0-312-42211-3. JEL 87-0557

Seven papers based on contributions to the third international economics conference held at the University of Surrey in April 1985. Theme of conference centered around two topics: the advisability and implications of the Slepner decision (decision of the British government to block the British Gas Corporation's decision to buy Norwegian gas from the Slepner field) and the future supply and demand balance in the European context. Focuses on problems relating to lack of flexibility in gas markets, the fixed contracts in gas transactions, the consequences of government intervention, and the uncertainty of forecasting demand and supply. Two papers present an overview of the international gas market, emphasizing those factors that interfere with market efficiency. Three contributions examine the gas situation in specific countries—Norway, the United Kingdom, and the U.S.S.R. One essay examines Western European gas markets, supporting deregulation as a policy

leading to lower prices and an expansion in demand. The final paper describes the potential of the Arab world as a source of gas exports. The contributors are economists, energy industry executives, and energy specialists. Stevens is Lecturer in Economics at the University of Surrey. No index.

UNITED NATIONS CENTRE ON TRANSNATIONAL CORPORATIONS. *Transnational corporations in the international semiconductor industry*. U.N. Publications sales no. E.86.II.A.1. New York: United Nations, 1986. Pp. xxvii, 471. \$41.00, paper. ISBN 92-1-104174-0. JEL 87-0558

Analyzes transnational corporations (TNCs) in the context of the structure, production, and market characteristics of the international semiconductor industry. Purpose is to increase understanding of the participation and strategies of TNCs in the industry and enhance the ability of host countries to establish appropriate policies and improve their negotiating capability. Presents information about definitions and applications of the industry, its products, and technology, world market and production, international trade in semiconductors, production characteristics, role of U.S., Japanese, and Western European TNCs in world production, industry restructuring and evolving TNC strategies, TNC participation in developing countries or areas, selected developing countries and their participation in the international semiconductor industry, and prospects for the future. Conclusion is that the priority on economic development of semiconductor industry will be determined by French, Russian, and Spanish.

UNITED NATIONS STATISTICAL COMMISSION AND ECONOMIC COMMISSION FOR EUROPE. *Correspondence table between the international standard industrial classification of all economic activities of the United Nations (ISIC) and the classification of branches of the national economy of the Council for Mutual Economic Assistance (CBNE)*. Conference of European Statisticians. Statistical Standards and Studies series, no. 38. New York: United Nations, 1986. Pp. vi, 73. \$9.50, paper. ISBN 92-1-016162-3. JEL 87-0559

A correspondence table between the International Standard Industrial Classification (ISIC) of the UN and the classification of branches of the national economy (CBNE) employed by CMEA countries. Part 1 details the key for conversion of data classified according to ISIC into CBNE group-

ings. Part 2 presents a key for the conversion of data classified according to CBNE into ISIC categories. In English and Russian. No index.

U.S. DEPARTMENT OF COMMERCE. *A competitive assessment of the U.S. civil aircraft industry*. International Competitive Assessment Series. Boulder and London: Westview Press, 1986. Pp. 172. \$25.00, paper. ISBN 0-8133-7254-2.

JEL 87-0560

Examines the prospects for continued international competitiveness of the U.S. civil aircraft industry. Identifies key factors that will determine the shape of future competition. Develops alternative scenarios for the future, as well as a framework for monitoring and measuring these developments. Points out that the industry no longer enjoys a large domestic market, but must compete in both domestic and international arenas. Describes the industry, noting key features such as a high degree of concentration, close linkages between supplier and customer, a low volume/high value project line, and reliance on military as well as civilian markets, and a significant reliance on export markets. Discusses the evolution of the civil aviation industry and its relationships with the federal government; technological evolution and performance beginning with World War I; recent industry performance; past and current competitiveness, emphasizing large transports; trends and factors influencing the future; future international competitiveness; and the future of general aviation aircraft and helicopters. Bibliography; no index.

WASOW, BERNARD AND HILL, RAYMOND D., eds. *The insurance industry in economic development*. New York and London: New York University Press, 1986. Pp. xxvi, 268. \$45.00. ISBN 0-8147-9211-1.

JEL 87-0561

Fourteen essays representing results of a series of conferences on the insurance industry held by the Gallatin Division of New York University. Three essays place the study of insurance in the perspective of recent international developments, examining the service sector in developing countries, the role of reinsurers in developing countries, and insurance industry technology and its transfer. Two essays in Part 2 examine the influence of insurance and reinsurance on the balance of payments. The impact of insurance on investment is treated in two essays in Part 3, emphasizing the role of financial institutions and markets on capital formation and development and insurance and intermediation. Part 4 reviews the impact of regulation on insurance growth. The papers in Part 5 present the results of case studies: French insur-

ance nationalization, Brazilian market consolidation in the 1970s, Indian nationalization, the Korean experience, and postwar development in Japan. The contributors are economists, financial and insurance specialists, business executives, and government agency officials. Wasow is an Associate Professor of Economics at New York University. Hill is Senior Vice President at Shearson Lehman American Express Corporation. Index.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

BELDEN, JOSEPH N., ET AL. *Dirt rich, dirt poor: America's food and farm crisis*. Alternative Policies for America series. New York and London: Routledge and Kegan Paul in association with Methuen for the Institute for Policy Studies/World Hunger Year, 1986. Pp. xii, 188. \$27.50, cloth; \$12.95, paper. ISBN 0-7102-0666-6, pbk.

JEL 87-0562

Covers production, distribution, and consumption of food, analyzing both international and domestic problems. Addresses key questions such as: why are there hunger and disease in the midst of plenty and affluence and why does the American food system not benefit producers, food industry workers, and consumers? Finds that most of the important problems are related to the control of agricultural production; the control of food marketing; natural resources and the environment, notably reliance on fossil fuel based energy; issues related to food consumption; and factors related to international trade and development assistance. Presents an array of goals for the U.S. food system, including: an abundant supply at reasonable prices; the production of healthy and nutritious foods, adequate food assistance for those in need; economic and social equity for the producers; income stability and profit for the farmers; encouragement of the family farm; minimal damage to the environment; and a contribution to the elimination of world hunger. Coauthors are: Vincent P. Wilber, Enid Kassner, Rus Sykes, Ed Cooney, Lynn Parker, Alan Sanders, Cynthia Schneider, and Marsha Simon. Belden is a research specialist for the Housing Assistance Council, Washington, D.C. Bibliography; index.

BROWNE, WILLIAM P. AND HADWIGER, DON F., eds. *World food policies toward agricultural interde-*

*pendence*. Boulder, Colo.: Rienner, 1986. Pp. x, 220. \$26.50. ISBN 0-831477-79-4.

JEL 87-0563

Fourteen papers examine the challenges of food policy decision making in developed and developing agricultural nations, as well as relationships of public policy and global interdependency. Following an overview on the issues of world food and trade, papers deal with: U.S. agriculture in a global food system; public policies in developed and developing agricultural nations; and issues related to dependence, development, and interdependence (role of world food organizations, the social, developmental, and political impacts of food aid, and world food linkages and U.S. leadership). Contributors are mainly political scientists and agriculture and trade specialists. Browne is Professor of Political Science, Central Michigan University. Hadwiger is Professor of Political Science, Iowa State University. Index.

EASTER, WILLIAM K., ed. *Irrigation investment, technology, and management strategies for development*. Studies in Water Policy and Management, no. 9. Boulder, Colo., and London: Westview Press, 1986. Pp. xxvii, 270. \$27.50. ISBN 0-8133-7177-5.

JEL 87-0564

Fourteen papers discuss key issues relevant to strategies for irrigation investment and management. Three papers outline a conceptual model of irrigation management and review problems and priorities for irrigation planning, investment, and implementation. Three papers deal with India, covering problems of Indian irrigation and strategies and choice criteria for tank irrigation to improve agricultural productivity. Four papers are devoted to irrigation development in Thailand and discuss the role of irrigation for improvement in rice production, the economic river pump and small tank irrigation systems, and the impact of a pilot irrigation project funded by the Asian Development Bank. Two papers deal with the irrigation projects in Pakistan and Egypt. Two papers argue for a reorientation of irrigation investment policies and present policy and research recommendations. The contributors are mainly agricultural economists. Easter is a Professor of Agricultural and Applied Economics, University of Minnesota, St. Paul. Author and subject indexes.

GOMEZ, ARTURO A. *Philippines and the CGIAR Centers: A study of their collaboration in agricultural research*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 15. Washington, D.C.: World Bank, 1986. Pp. xii, 70. \$5.00, paper. ISBN 0-8213-0824-6.

JEL 87-0565

Analysis of the effectiveness of collaboration between the International Agricultural Research Centers (IARCs) and the Philippine National Agricultural Research System (NARS). Provides background material on the Philippines and its agricultural sector and outlines the structure of NARS. Evaluates the impact of IARCs on the NARS with respect to improvements in the research capacity of the latter. Assesses the research impact on agricultural production and the effectiveness of the IARCs model. Gomez is Professor of agronomy at the University of the Philippines, Los Baños. No index.

ISARANGKURA, RUNGRUANG. *Thailand and the CGIAR centers: A study of their collaboration in agricultural research*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 16. Washington, D.C.: World Bank, 1986. Pp. x, 94. \$5.00, paper. ISBN 0-8213-0825-4.

JEL 87-0566

Analysis of the effectiveness of collaboration between the International Agricultural Research Centers (IARCs) and the national agricultural research system of Thailand. Describes the agricultural sector of Thailand and the evolution of the national agricultural research system. Presents the perceptions in the national research system of the IARCs and the views of professionals in the commodity programs regarding collaboration with the IARCs. The author is Director of the Agricultural Planning Sector of the Ministry of Agriculture and Social Development. Index.

LOWENBERG-DEBOER, J. *Capital and the roots of the farm*. Greenwood Press, 1986. Pp. xiv, 270. \$42.95. ISBN 0-275-21000-0.

Analyses capital gains and losses in farm management in the United States during the post-World War II period. Provides a series of approximations to the farm firm decision environment. Develops a static model that assumes constant input levels, extends the model to allow for changing input levels and financial restructuring during the planning period and for limited availability of land, adjustment costs, and equity investment limits, and incorporates the impact of land price risk. Tests the model using data from an illustrative Iowa farm firm for the period 1970-84. Some general conclusions are that farm bankruptcies and other financial problems of the 1980s are signs of the inadequacy of past lender policy, poor farm-level decisions, and counterproductive government price support and credit programs. Lowenberg-DeBoer is Asst.

tant Professor of Agricultural Economics, Purdue University. Index.

PAZ SILVA, LUIS J. *Peru and the CGIAR centers: A study of their collaboration in agricultural research*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 12. Washington, D.C.: World Bank, 1986. Pp. xii, 136. \$8.00, paper. ISBN 0-8213-0788-6.

JEL 87-0568

Analysis of the effectiveness of collaboration between the International Agricultural Research Centers (IARCs) and the national agricultural research system in Peru. Provides highlights of the Peruvian farm sector and of the national agricultural research system. Assesses the impact of IARCs on the agricultural research system. Evaluates the impact of research on production of rice, maize, potatoes, beans, and wheat. The author is President of the National Development Foundation of Peru and Head of the Department of Economics of the National Agrarian University, La Molina. No index.

POSADA TORRES, RAFAEL. *Ecuador and the CGIAR Centers: A study of their collaboration in agricultural research*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 11. Washington, D.C.: World Bank, 1986. Pp. x, 75. \$5.00, paper. ISBN 0-8213-0787-8.

JEL 87-0569

Analysis of the effectiveness of collaboration between the International Agricultural Research Centers (IARCs) and the national agricultural research system in Ecuador. Provides information regarding the macroeconomic aspects of Ecuador's agricultural sector and the supply and demand for IARC products. Describes the historical development, structure, and achievements of the national research system of Ecuador. Discusses the interaction between the IARCs and the national research system as well as the contribution of other bilateral and multilateral agencies. Outlines the impact of research on production. Torres is Head of the Economic Division of FEDERARROZ, a national organization of rice producers in Ecuador. No index.

REVEL, ALAIN AND RIBOUD, CHRISTOPHE. *American green power*. Translated by EDWARD W. TANNER. Baltimore and London: Johns Hopkins University Press, [1981] 1986. Pp. xiii, 225. \$30.00, cloth; \$12.95, paper. ISBN 0-8018-2434-6.

JEL 87-0570

Translation of a book originally published in French as *Les États-Unis et la stratégie alimentaire mondiale* (1981). Analyzes the performance and

techniques of American agriculture to highlight the dominant role of U.S. agricultural policy and strategy for the world economy. Part 1 covers the state of the world food and agricultural balance. Part 2 analyzes the objectives, content, and instruments of American agricultural policy and strategy. The authors argue that there are distinct similarities between the power of the United States over the world food supply and that of OPEC over energy. Revel is Executive Vice-President of GERSAR, Inc., Paris. Riboud is a Professor at the Agro-Food Institute, Paris. Index.

RICHARDS, ALAN, ed. *Food, states, and peasants: Analyses of the agrarian question in the Middle East*. Boulder, Colo., and London: Westview Press, 1986. Pp. xvii, 282. \$27.00, paper. ISBN 0-8133-7117-1.

JEL 87-0571

Ten papers presented at an international workshop in Rome in September 1984. Papers discuss agricultural development, its social and distributional effects, and the impact of economic policies. Part 1 is an historical review of the role of states, landlords, and peasants in Turkey and Egypt. Part 2 deals with the political economy of supply and investigates the effects of taxes and subsidies. Part 3 discusses the political conflict associated with food subsidies. Part 4 covers the transformation of the rural agricultural labor force. The contributors are A. Tosun Aricanli, Richard H. Adams Jr., Harold Alderman, Haluk Kasnakoglu, Roger Owen, Samir Radwan, David Seddon, Kutlu Somel, Suday Uner, and the editor. Richards is Associate Professor of Economics at the University of California, Santa Cruz. No index.

SANCHEZ, PEDRO A. AND SCOBIE, GRANT M. *Cuba and the CGIAR Centers: A study of their collaboration in agricultural research*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 14. Washington, D.C.: World Bank, 1986. Pp. xiv, 120. \$8.00, paper. ISBN 0-8213-0823-8.

JEL 87-0572

Analysis of the effectiveness of collaboration between the International Agricultural Research Centers (IARCs) and the national agricultural research system of Cuba. Provides information regarding the structure of the Cuban economy and agricultural sector, and the nature of food production, consumption, and distribution. Describes the framework of the national agricultural research system and the nature of collaboration in research on rice, beans, cassava and tropical starchy crops, tropical pastures, potatoes, maize, and sorghum. Assesses research impact on agricultural production. Sanchez is Professor of Soil Science at North

Carolina State University. Scobie is Senior Agricultural Economist at Ruakura Agricultural Research Center in Hamilton, New Zealand. No index.

SCOTT, GREGORY J. *Markets, myths, and middlemen: A study of potato marketing in central Peru*. Lima: International Potato Center (CIP), 1985. Pp. xii, 184. \$9.00. JEL 87-0573

Argues that popular ideas about potato marketing in Peru are erroneous, for example, disorganized rural assembling, high freight rates and high marketing costs, exorbitant wholesaler margins, too many middlemen, and the replacement of potatoes with rice. Begins with a review of approaches to food marketing and a historical examination of potato production, distribution, and consumption, with special attention to costs, prices, and margins. Presents a historical review of potato production, consumption, and marketing, indicating how marketing patterns generate structural changes in the potato sector. Also presents further details about assembling and transportation, integrating the discussion with analyses of costs, margins, and profits. Data are from particular regions, such as the Manjaro Valley, Canete, and Lima. Scott is in the Social Science Department of the International Potato Center, Lima, Peru. Bibliography; no index.

TIMMER, C. PETER. *Getting prices right: The scope and limits of agricultural price policy*. Ithaca and London: Cornell University Press, 1986. Pp. 160. \$25.00, cloth, \$7.95, paper. ISBN 0-8014-9441-9, pbk. JEL 87-0574

Essay/primer for analysts and practitioners on how to think systematically about the impact and desirability of a change in agricultural price policy and what the scope and limits of agricultural price policy are. Uses a static and partial-equilibrium framework with a border price paradigm as the starting point for a welfare analysis of price policy interventions. Considers: implementation issues and impact on the domestic marketing sector and relative roles of public and private marketing agencies as a function of price policy; nature of the world market price, disaggregated effects of price policy on producers and consumers; short-run macro effects on budgetary, fiscal, and monetary policy; impact of macro prices, especially the foreign-exchange rate; spillover effects of price policy for one commodity market on other commodity and factor markets, on the agricultural sector, and on the entire economy; and dynamic effects through micro decision making and the macroeconomy on employment, the composition and size of investment, and structure and rate of economic growth. The concluding chapter discusses markets,

politics, and the dynamics of price changes. Timmer is John D. Black Professor of Agriculture and Business, Graduate School of Business Administration, Harvard University. Index.

TSHIBAKA, TSHIKALA B. *The effects of trade and exchange rate policies on agriculture in Zaïre*. Research Report series, no. 56. Washington, D.C.: International Food Policy Research Institute, 1986. Pp. 65. Paper. ISBN 0-89629-057-3.

JEL 87-0575

One of a series of studies undertaken by the International Food Policy Research Institute (IFPRI) on trade and exchange rate regimes and how they affect agricultural incentives in developing countries. Examines the extent to which overvalued exchange rates have discriminated against agricultural exports and agriculture in general. Argues that because the mineral sector is regarded as the engine of the Zairian economy, other sectors, particularly agriculture, have suffered discrimination. Covers policies directed specifically toward agriculture and also those aimed at other sectors. Notes that Zaïre has undergone three phases since 1960: 1960-65 with political crisis and economic disorder, 1966-70 marked by international aid and less restrictive exchange-rate policies, and 1971-82 characterized by restrictive trade and exchange-rate policies and the trade-off between food and export crops. Concludes that the domestic prices of food commodities were kept well below the world price as an incentive to encourage industrialization and agricultural and nonagricultural development. Includes a appendix and the production through government industry with charts as a research findings, bibliographies.

## 720 NATURAL RESOURCES

CUREFF, T. RANDALL. *The economic feasibility of recycling: A case study of plastic wastes*. New York and London: Greenwood Press, Praeger, 1986. Pp. xiv, 203. \$39.95. ISBN 0-275-92376-2.

JEL 87-0576

Addresses the problems associated with plastics recycling from an economic perspective and reviews numerous economic and institutional factors that may determine whether future plastic wastes will be disposed of or recycled. Indicates that while

there is disagreement about the extent to which plastics cause waste disposal environmental problems, there is agreement that disposal is becoming increasingly expensive and a public policy concern. Examines both the incentives and barriers to recycling. Discusses recycling processes, various disposal methods and how they affect the environment, the role of the private and public sectors in making disposal decisions, international comparisons, historical and projected U.S. resin production, the cost of recycling versus disposal and different recycling approaches, and incentives and barriers to recycling in selected market sectors—electrical and electronics, beverage bottles, and automobile shredding. Concludes with a series of questions and recommendations dealing with environmental implications, what the private sector can be expected to do, whether there is a need for public sector planning, and whether recycling is a feasible alternative to disposal. Curlee is with the Oak Ridge National Laboratory. Bibliography; index.

- DIXON, JOHN A. AND HUESCHMIDT, MAYNARD M., eds. *Economic valuation techniques for the environment: A case study workbook*. Baltimore and London: Johns Hopkins University Press, 1986. Pp. xx, 203. ISBN 0-8018-3352-3.

JEL 87-0577

Ten papers outline a broad approach to the valuation of the environmental and natural systems effects of development projects. Three papers discuss the real-world role of economic analysis for project evaluation, present a hypothetical case study of the financial and economic analyses of a project, and outlines the principles of cost-benefit analysis and of its extension to valuation of environmental quality. Seven papers illustrate the organization and use of these techniques in case studies of upland agricultural projects in South Korea; a geothermal power plant project in the Philippines; the coastal development of Tokyo Bay; a public park in Bangkok, Thailand; a water resources project in Thailand; fuelwood production and use in the Philippines; and water pollution control options in China. The contributors are mainly environmental specialists. Index.

- HAMPSON, FEN OSLER. *Forming economic policy: The case of energy in Canada and Mexico*. Studies in International Political Economy series. New York: St. Martin's Press, 1986. Pp. x, 161. \$27.50. ISBN 0-312-29944-3.

JEL 87-0578

Examines how governments achieve reform; in particular, how national crises change political values and behavior. Argues that in times of national crises government strategies, policies, decisions,

and actions are motivated by macropolitical considerations as opposed to micropolitical considerations in the absence of a crisis. Illustrates the argument with reference to the pattern of Canadian and Mexican energy policies during the 1970s and early 1980s. Discusses the theoretical framework in the context of the Canadian and Mexican political systems. Examines the energy policies of the two countries prior, during, and after their domestic energy crises. Concludes that possibilities for reform depend on a shared sense of crisis among political elites. Hampson is a Research Fellow, Center for Science and International Affairs, John F. Kennedy School of Government, Harvard University. Bibliography; index.

- MABRO, ROBERT, ET AL. *The market for North Sea crude oil*. Oxford; New York; Toronto and Melbourne: Oxford University Press for the Oxford Institute for Energy Studies, 1986. Pp. xxxii, 341. \$54.00. ISBN 0-19-730001-4.

JEL 87-0579

Investigates the significance of the North Sea and the market for North Sea crudes in the world petroleum market. Examines the physical characteristics of North Sea crudes and blends and relevant statistical features of the fields that produce them. Describes the pattern of international trade in North Sea crude oil, the structure of the market, and costs and time patterns of production. Discusses the licensing and production policies of the United Kingdom and Norway; the place and role of their major oil corporations, and the fiscal regime applied to oil in the two countries. Analyzes the behavior of spot prices, their trends and variability, the behavior of price differentials, and the relationships between North Sea crude prices and those of other world crudes. Concludes that growth of North Sea oil production will not continue at its recent rate and an increase in the volume of forward trading can only take place by diversification into crudes other than Brent. Coauthors are Robert Bacon, Margaret Chadwick, Mark Halliwell, and David Long. Mabro is Director, Oxford Institute for Energy Studies. Glossary, no index.

- PONTECORVO, GIULIO, ed. *The new order of the oceans: The advent of a managed environment*. New York and Gildford, Surrey: Columbia University Press, 1986. Pp. xv, 277. \$30.00. ISBN 0-231-05870-5.

JEL 87-0580

Ten contributors discuss the new order or system for governing the oceans, addressing questions such as how and why the new order has evolved from the concept of freedom of the seas, which has existed for four centuries. Volume was developed from a Columbia University seminar, "On the Uses of the Oceans." Papers in Part 1 discuss

the new regime of the oceans, overviewing the role of oceans in historical economic development, tracing the transition from the open ocean system to today's struggle to increasing relative scarcity, which requires management at both the national and international levels, and discussing problems imbedded in the 1982 United Nations negotiations over the Law of the Sea Treaty. Part 2 examines ocean resources and the impact of new technology in recovering them. The third part presents voices of the "new regime"—Africa, Latin America, and Southeast Asia. The last part discusses the role of the United States in the Law of the Sea Negotiations and examines issues unresolved or omitted from the Law of the Sea Convention agenda. Contributors are mainly lawyers, economists, national representatives, and specialists in marine science and technology management. Pontecorvo is Professor of Economics at the Graduate School of Business, Columbia University. Index.

UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE AND FOOD AND AGRICULTURE ORGANIZATION. *The forest resources of the ECE region (Europe, the USSR, North America)*. Geneva. Author, 1985. Pp. v, 223. \$21.00, paper. ISBN 92-1-116344-7.

JEL 87-0581

An assessment of the forest resources of the ECE region. Part 1 presents general forest resource inventory data. Part 2 deals with the volume and mass of tree and other woody biomass. Part 3 outlines the role of the forest in supplying environmental and other nonwood goods and services. Appendices present details of the study and statistical data. No index.

VENN, FIONA. *Oil diplomacy in the twentieth century*. Making of the 20th Century series. New York: St. Martin's Press, 1986. Pp. xii, 228. \$29.95. ISBN 0-312-58307-9.

JEL 87-0582

Analysis of the historical role of oil in international relations. Examines the impact of oil on intergovernmental relations as well as its role as a multinational enterprise affected by the policies of countries in which it operates. Discusses the nature of oil diplomacy during the period 1900-1914, the impact of First World War on the political context of petroleum ownership and trade, and the Anglo-American oil war and the growth of oil nationalism in the interwar years. Outlines the role of petroleum during World War II and oil diplomacy and national security between 1945 and 1960. Reviews the reorientation of oil diplomacy with the formation of OPEC and the changes in the politics of trade in petroleum since 1973. Venn is Lecturer in History at the University of Essex. Select bibliography; index.

See also: Book Numbers JEL 87-0594, 87-0603

### 820 LABOR MARKETS; PUBLIC POLICY

AKERLOF, GEORGE A. AND YELLEN, JANET L., eds. *Efficiency wage models of the labor market*. Cambridge, New York and Melbourne: Cambridge University Press, 1986. Pp. ix, 178. \$29.95, cloth, \$9.95, paper. ISBN 0-521-32156-5.

JEL 87-0583

Ten papers, all previously published, examine efficiency wage models. The articles focus on three general areas. (1) rationales for efficiency-wage-generated unemployment, (2) the implications of certain model assumptions for contract forms and internal labor markets, and (3) the use of the models in development economics. Some specific topics are: the theory of unemployment in densely populated backward areas, equilibrium unemployment as a worker discipline device, labor contracts as partial gift exchange, a model of the natural rate of unemployment, job queues and layoffs in labor markets with flexible wages, hierarchy, ability, and income distribution, and unemployment insurance and labor contracts. The editors are at the University of California, Berkeley.

BERKOWITZ, MONROE. *Disability and the labor market: policies, and programs*. New York: ILR Press, 1986. Pp. ix, 288. \$34.00. ISBN 0-87546-125-5.

JEL 87-0584

Ten papers presented at a meeting on the economics of disability in Washington in April 1985. Specific essays deal with social security disability policy in the 1980s, labor supply incentives and disincentives for the disabled, lessons learned from the worker compensation program, worker compensation and employment, transitional and supported employment, job displacement, accommodating disabled persons in private industry, and the Rehabilitation Act and discrimination against the handicapped. The final paper compares disability policy in the United States with those of Sweden and the Netherlands. Concludes that disability policy in the United States has not been developed

in a unified or coherent manner and that funds should be invested in disability prevention. Berkowitz is Professor of Economics and Hill is an Assistant Professor of Economics, both at Rutgers University. Index.

BJÖRKMAN, JAMES WARNER, ed. *The changing division of labor in South Asia: Women and men in India's society, economy, and politics*. Riverdale, Md.: Riverdale, 1986. Pp. xiv, 152. \$19.00. ISBN 0-913215-05-8. JEL 87-0585

Ten papers that are revised versions of presentations made at a symposium held at the University of Wisconsin in November 1984. Papers examine South Asia's changing division of labor and, in particular, its relation to roles of women in society, the economy, and politics. Six papers address the impact of technology on the changing division of labor in South Asia in terms of political and economic participation and government policies. Some topics are: changing gender roles in rural areas; work, gender, and technology in the informal sector in India; the impact of new technologies in agriculture; and industrial technologies and policies in India. Four papers consider the perceived value of women's work, patterns of ethnic identification, and political participation. The contributors are mainly economists and social scientists specializing in economic development and agriculture. The author is a political scientist specializing in the comparative politics of health, public policy, and administration. Index.

CHIELIUS, JAMES, ed. *Current issues in workers' compensation: Papers presented at a conference sponsored by: The Institute of Management and Labor Relations and the Bureau of Economic Research, Rutgers, The State University of New Jersey; The New York State School of Industrial and Labor Relations, Cornell University; and The Economics Department, the University of Connecticut*. Kalamazoo, Mich.: W. E. Upjohn Institute for Employment Research, 1986. Pp. vi, 372. Paper. ISBN 0-88099-036-8. JEL 87-0586

Fourteen papers discuss the status of, and trends in, worker's compensation. Topics include: the Minnesota experience; the 1982 changes in California; workers' compensation reform in Michigan; the politics of workers' compensation reform; interstate variations in employers' costs; the determination and regulation of workers' compensation insurance rates; the administration of workers' compensation; federal occupational disease legislation; and the impact of accident compensation on managerial perceptions and behavior in New Zealand. The contributors are mainly economists, lawyers, industrial relations specialists, government

officials, and management specialists. Chelius is associated with the Institute of Management and Labor Relations, Rutgers University. No index.

CORSON, WALTER; HERSHEY, ALAN AND KERACHISKY, STUART. *Nonmonetary eligibility in state unemployment insurance programs: Law and practice*. Kalamazoo, Mich.: W. E. Upjohn Institute for Employment Research, 1986. Pp. xvii, 138. \$19.95, cloth. \$14.95, paper. ISBN 0-88099-038-4, pbk. JEL 87-0587

An investigation of the effect of state laws, regulations, and procedures on nonmonetary eligibility for unemployment insurance. Based on regression analysis of quarterly state data for the period 1964-81, the study assesses the relationship between each major category of nonmonetary eligibility and a set of variables reflecting the guidelines of state laws. The rate of denial of benefits on the basis of nonmonetary rules is used as a measure of the state's effectiveness at enforcing rules. Outlines means whereby state agencies can minimize violation of nonmonetary eligibility rules and detect and deal with any violations that occur. Corson and Kerachsky are both Senior Economists and Hershey is a Senior Policy Analyst at Mathematica Policy Research, Inc. No index.

DANSON, MIKE, ed. *Redundancy and recession: Restructuring the regions?* Norwich, England: Geo Abstracts, Geo Books, 1986. Pp. xii, 174. £ 25.00. ISBN 0-86094-201-5. JEL 87-0588

Eleven papers, most originating at a meeting of the U.K. Economic and Social Research Council's Urban and Regional Economics Seminar Group at the University of Reading in July 1983. Papers consider aspects of the recession and economic crisis from 1980 to 1984. Topics include: the urban-rural shift and employment change in Britain, 1971-81; employment impact of the Merseyside motor vehicle assembly industry; labor adjustment and the limits to voluntary choice; unemployment in the relatively prosperous region of Hertfordshire; Austrian and Canadian experiences with regional restructuring; trade unions, consultation, and redundancies; and the longer term impact of policies of regeneration at the local level. The contributors are mainly economists and urban and regional development specialists. Danson is at Glasgow University. No index.

GEORGE, VICTORIA AND HEMBREE, WILLIAM E. *Breakthroughs in health-care management: Employer and union initiatives*. New York: Oxford: Toronto and Sydney: Pergamon Press, 1986. Pp. x, 213. \$22.50. ISBN 0-08-032709-2. JEL 87-0589

Contains twenty-five case studies of programs of major employers, unions, and communities in the United States that have achieved both cost-effective and high-quality health care. They are chosen to illustrate the importance and role of comprehensive overall health-care cost containment strategies and plans, employee incentives, alternative delivery systems, labor-management joint efforts, union initiatives, and focused programs. Some examples of specific programs cited are those of: Johnson & Johnson, Honeywell, Hewlett-Packard, the UAW, Toledo Business Coalition on Health Care, and the Cornell University-New York Hospital. George is a health research analyst and Hembree is Director, Health Research Institute, Walnut Creek, California. Glossary; index.

GINZBERG, ELI; NOYELLE, THIERRY J. AND STANBACK, THOMAS M., JR. *Technology and employment: Concepts and clarifications*. Boulder, Colo., and London: Westview Press, 1986. Pp. xi, 111. \$27.50. ISBN 0-8133-0399-0. JEL 87-0590

First of four studies presenting the research on technology and employment conducted by Conservation of Human Resources of Columbia University. Identifies the major impacts of the computer-communications technology on the employment of various groups that are especially vulnerable to the changes that are taking place. Argues that the increased skill requirements caused by these technological changes are affecting those least prepared, least trained, and least educated. Advocates an increasing emphasis on education and training of the displaced workers. Describes work force trends, technology and women, technology and equal employment opportunity, technology and metropolitan economies, especially the rise of services, and a case study of New York City. Concludes with a discussion of directions for policy and future research. Ginzberg is A. Barton Hepburn Professor Emeritus at Columbia University. Noyelle is a senior research scholar, Conservation of Human Resources, Columbia University. Stanback is a Professor of Economics at New York University. Index.

GRUBEL, HERBERT G. AND BONNICI, JOSEF. *Why is Canada's unemployment rate so high? A labour market and technology explanation of the divergence of unemployment rates in Canada and the United States 1960-85*. Focus series, no. 19. Vancouver, British Columbia: Fraser Institute, 1986. Pp. viii, 68. \$5.00, paper. ISBN 0-88975-049-0. JEL 87-0591

Persistently high unemployment rates in Canada are discussed in the context of the divergence of

Canadian/U.S. rates. Finds that the macroeconomic determinants of unemployment do not explain recent North American developments. Notes that differences in the level of demand stimulation do not explain the divergence. Concludes that monetary policy had about the same effect on demand in both countries. Attributes most of the divergence in rates to microeconomic factors, such as a 40 percent faster growth in real wages in Canada (1965-84), more rapid use of capital and technology as labor saving policies in Canada, and a more rapid rise in productivity in Canada. Also argues that more lucrative unemployment compensation policies in Canada delay the process of seeking work by the unemployed. Concludes that Canada must realign its real wage and productivity levels and institute structural changes to increase the flexibility of real wages. Grubel is Professor of Economics at Simon Fraser University. Bonnici is Lecturer at Deakin University, Geelong, Australia. No index.

LALONDE, ROBERT AND PAPANDREOU, NICK. *The manpower report of KEPE. The characteristics of the Greek labor market*. Centre of Planning and Economic Research. Analyses of Statistical Data series, no. 4. Athens: Centre of Planning and Economic Research, 1986. Pp. 122. Paper. JEL 87-0592

Reference book of data on the Greek Labor market that surveys recent employment and unemployment trends in Greece with emphasis on the composition of the labor force. The report covers type of occupation, type of occupation changed over time, present and discussed type of compensation, type of compensation in manufacturing industries, the rural sector, Labor Force Survey, Statistical Service of Greece. Two-thirds of the report contain statistical tables compiled from several sources of labor market data, they pertain to characteristics of employment and unemployment, statistics on population, education and labor force, hours and earnings in agriculture and non-agriculture establishments, and monthly strike data for 1976-83. The authors are at the Centre of Planning and Economic Research, Athens and Princeton University. Bibliography, no index.

PHILIP, NORMAN E. *The cash incentive: The economic response of semi-subsistent craftworkers in Papua New Guinea*. Pacific Research Monograph series, no. 13. Canberra: Australian National University,

National Centre for Development Studies, 1986. Pp. xii, 135. Paper. ISBN 0-86784-984-3.

JEL 87-0593

Describes and analyzes aspects of the economic behavior of a small group of piece-rate cash workers in a Melanesian economy in transition from a traditional subsistence to a cash economy. Presents the geographical environment in which the weavers lived and worked, the structure of the weaving industry, and demographic characteristics of the weavers and their families. Studies the monetary and nonmonetary incomes of the weaver households and accounts for the monetary outlays and activity patterns of sampled workforce members. Develops a formal econometric model of labor effort response that allows the effect of wage-rate variation on effective work effort to be isolated and measured. Finds that slightly less than 40 percent of the potential earning capacity was used by the average member of this workforce. The concluding chapter evaluates the results, merits, limitations, and policy implications of the study. Philp is Senior Lecturer in Economics, Riverina-Murray Institute of Higher Education, Wagga Wagga, New South Wales, Australia. No index.

VILLA, PAOLA. *The structuring of labour markets: A comparative analysis of the steel and construction industries in Italy*. Library of Political Economy series. Oxford; New York; Toronto and Melbourne: Oxford University Press, Clarendon Press, 1986. Pp. xi, 420. \$64.00, cloth; \$29.95, paper. ISBN 0-19-828508-6.

JEL 87-0594

Investigates the issue of labor market segmentation, developing the theoretical position by comparing the steel and construction industries in Italy. Focuses on the forces that determine the structuring of labor markets and investigates how and why workers with similar characteristics are treated differently in different segments of the labor market. Analyzes the structure of the labor market in the two industries, including the impacts of technological conditions, the influence of division of labor, and the internal organization of the jobs. Examines the dynamics of labor market structure, analyzing the role of labor/management relations and the evolution of labor market structures in the two industries. Conclusions discuss the structuring of labor markets, favoring the noncompeting wage group argument. Contends that "laborer market structures . . . do not exist in a vacuum: economic and technological factors differ between historical periods, economic systems, sectors, industries, and firms." Based on the author's Ph. D. dissertation at the University of Cambridge. Villa is a researcher in the Faculty of Economics at the Catholic University in Milan. Index.

ZABALZA, A. AND TZANNATOS, Z. *Women and equal pay: The effects of legislation on female employment and wages in Britain*. Cambridge; New York and Melbourne: Cambridge University Press, 1985. Pp. ix, 140. \$29.95. ISBN 0-521-30188-2.

JEL 87-0595

Argues that the factor responsible for the increase in female relative wages in Britain in the last decade or so was almost exclusively the anti-discrimination legislation. Finds that incomes policies had both a minor and short-lived effect. Attributes the improvement in women's relative wages to increases in relative pay within sectors and not to shifts in female employment from low- to high-paying jobs. Further, the improvement has not been accomplished at the expense of employment, since hours worked by women have increased relative to hours worked by men. Notes that the effects of legislation have been less satisfactory in the United States than in Britain, partly due to the nature of collective bargaining agreements in the United States. Projects that future improvements in relative female-male wages might be more difficult to achieve. Draws on the *New Earnings Survey* for much of the statistical information. Zabalza is Professor of Economics, University of Valencia and Tzannatos is Lecturer in Economics, University of Buckingham. Author and subject indexes.

### 830 TRADE UNIONS; COLLECTIVE BARGAINING; LABOR-MANAGEMENT RELATIONS

DORE, RONALD. *Flexible rigidities: Industrial policy and structural adjustment in the Japanese economy, 1970-80*. Stanford, Calif.: Stanford University Press, 1986. Pp. 278. \$32.50. ISBN 0-8047-1328-6.

JEL 87-0596

Argues that the Japanese work ethic assumes that workers can be trusted to be concerned about the quality of their output. Also notes quality, service, and loyalty as key attributes between buyers and sellers. Asserts that typical rigidities of the marketplace—unions, cartels, and tied dealerships—also exist in Japan, but that the economy has been able to adjust more readily and effectively than other nations to deal with the oil price increase, controlling inflation, and industrial shifts. After a survey of the major characteristics of the economy, focuses on the changes in economic structure during the decade and on "adjustive behavior" by businessmen, workers and their unions, and government. Presents a case study of the textile industry. A substantial part of this volume is based on a monograph by the author with contribu-

tions by Professor Kōji Taira of the University of Illinois and published by the International Labour Office as *Structural Adjustment in Japan, 1970-82*. Dore is the Reischauer Visiting Professor at Harvard University. Bibliography; index.

GREENBERG, EDWARD S. *Workplace democracy: The political effects of participation*. Ithaca, N.Y., and London: Cornell University Press, 1986. Pp. 259. \$29.95. ISBN 0-8014-1921-2. JEL 87-0597

Examines to what extent workplace democracy has achieved its goals, such as alleviating worker alienation, nurturing class consciousness as a strategy for superseding capitalism, and fostering political participation. This book is part of the final report of a study of the Pacific Northwest co-operatives, undertaken to examine whether evidence supports these claims. Describes the nature of the democratic Left and the appeals of workplace democracy in the United States and in other instances such as the Israeli Kibbutz, the Yugoslav system of worker self-management, the industrial democracy of Salvador Allende in Chile, the Mondragon co-operatives in Spain, and the numerous programs in Sweden and Norway. Examines the plywood co-operatives in greater detail from three traditions or perspectives—the problem of alienation, participatory democracy, and rejection of market capitalism and Soviet-style socialism in favor of "socialism with a human face." Discusses alienation in the co-operatives and compares the nature and extent of it with alienation in democratic industrial work settings in other societies. Presents a comparative analysis of class consciousness and examines the political effects of workplace democracy. Finds the U.S. experience less successful than the foreign ones in developing attitudes and behavior inconsistent with the prevailing social, economic, and political climate. Greenberg is Professor and Chair, Department of Political Science at the University of Colorado. Bibliography; index.

HERMAN, E. EDWARD; KUHN, ALFRED AND SEEBER, RONALD L. *Collective bargaining and labor relations*. Second edition. Englewood Cliffs, N.J.: Prentice-Hall, [1981] 1987. Pp. xviii, 621. ISBN 0-13-140575-6. JEL 87-0598

Second edition of a textbook designed for use by undergraduate and beginning graduate students in industrial relations and collective bargaining. Statistical materials and bibliography have been updated. Newer research findings are also incorporated. Reflects major changes in industrial relations, influenced by economic fluctuations, new technologies, foreign competition, and the Reagan administration. Focuses on the bargaining unit, preparation for bargaining, costing of labor con-

tracts, the bargaining process, management and union security, concessions, the bargaining simulation, and recent arbitration cases. In seven parts: development and growth of the labor movement; the legal framework; the framework of collective bargaining, preparation for bargaining and costing of labor contracts, the bargaining process—theory, power, negotiations, and impasses; the content of collective bargaining; and special topics. Also includes a collective bargaining simulation and arbitration cases. Herman is at the University of Cincinnati. The late Alfred Kuhn was at the University of Cincinnati. Seeber is at the New York State School of Industrial and Labor Relations, Cornell University. Bibliography; glossary; index.

INTERNATIONAL LABOUR OFFICE. *Job evaluation*. Geneva. Author, 1986. Pp. xi, 203. Paper. ISBN 92-2-103541-7. JEL 87-0599

Originally published in French under the title *L'évaluation des emplois*. A description of job evaluation, a management technique aimed at establishing pay structures within enterprises that are fair and equitable, and reducing the dissatisfaction associated with internal pay differentials. Describes the main features of job evaluation and outlines the basic steps in job analysis, description, and evaluation. Reviews different methods of job evaluation and certain issues and problems that arise in its application. Identifies the factors to be considered in the choice of method and examines internal job evaluation. Outlines equal pay through job evaluation. Discusses issues associated with job evaluation, advantages and disadvantages, and examples of job evaluation. Provides guidelines for the use of job evaluation.

KOCHAN, THOMAS A., KAUF, LEE, and SIE, ROBERT B. *The transformation of American industrial relations*. New York: Basic Books, 1986. Pp. xviii, 287. \$22.95. ISBN 0-465-08696-9. JEL 87-0600

Summarizes the findings, conclusions, and implications for theory, policy, and practice of a collaborative research project conducted at Massachusetts Institute of Technology. "U.S. Industrial Relations in Transition." Presents an account of the transformation of the New Deal system of collective bargaining. Discussions detail the transformation forces, such as concession bargaining, changes in work rules, and worker representation. Traces the post-World War II evolution of industrial relations, noting that they were shaped by the rise, maturation, and eventual weakening of the collective bargaining system. Describes the emergence of the

nonunion system of industrial relations, industrial relations at the workplace, the process and results of collective bargaining, the changing workplace, union engagement in strategic business decisions, and the workers' views of the process. Argues that industrial relations practices and outcomes are shaped by interactions of environmental forces along with the strategic choices of those involved in industrial relations policy and practice. Concludes with four scenarios presenting strategic choices for the future. Kochan and McKersie are Professors of Industrial Relations at the Sloan School of Management at Massachusetts Institute of Technology. Katz is Assistant Professor of Collective Bargaining at the New York State School of Industrial Relations at Cornell University. Index.

- LIPSKY, DAVID B. AND LEWIN, DAVID, eds. *Advances in industrial and labor relations*. A Research Annual series. Volume 3. Greenwich, Conn., and London: JAI Press, 1986. Pp. viii, 316. \$27.25. ISBN 0-89232-642-5. JEL 87-0601

Nine essays on industrial relations regulation, bargaining theory, progressive discipline, and occupational influences on unionism. Topics discussed include: collective bargaining in regulated industries; a theoretical and empirical analysis of delay in the union election campaign; a cost-benefit analysis of interest arbitration in the public sector; unions, turnover, and employment variation; a model of arbitration and the incentive to bargain; power dependence in collective bargaining; the origin, development, and consequences of progressive discipline in American industry; and job content, job status, and unionism. Lipsky is at the New York State School of Industrial and Labor Relations, Cornell University. Lewin is with the Graduate School of Business, Columbia University. No index.

- SHENFIELD, ARTHUR. *What right to strike?* With commentaries by CYRIL GRUNFELD AND SIR LEONARD NEAL. Hobart Paper series, no. 106. London: Institute of Economic Affairs; distributed in North America by Transatlantic Arts, Albuquerque, New Mexico, 1986. Pp. 64. \$7.50, paper. ISBN 0-255-36190-4. JEL 87-0602

Argues that the right to strike, compatible with a free society, means the right to withdraw one's labor, but does not include the right to keep others from working. Examines the confusion surrounding the unique legal status of unions, which enjoy some of the rights and powers of corporate bodies but yet themselves are not bodies corporate. Part 1 presents a detailed analysis of what is a strike, including legal definitions, rights and remedies, the

concept of unfair dismissal, and sit-ins. Part 2 examines the theory of the worker's bargaining disadvantage, such as the lack of reserve and labor being a perishable commodity. The final part presents fourteen points in a proposal for reform of trade unions. Shenfield has been a Visiting Professor at several American universities and Lecturer in Economics at the University of Birmingham. No index.

- SILVER, MARC L. *Under construction: Work and alienation in the building trades*. SUNY Series in the Sociology of Work. Albany: State University of New York Press, 1986. Pp. xi, 251. \$34.50, cloth; \$12.95, paper. ISBN 0-88706-308-X. JEL 87-0603

Reviews the organization and work relations in the construction industry, examining the effects of local market conditions, employer demands, and trade union activities on the daily lives of workers, both skilled and unskilled, all within the context of capitalist relationships. Challenges popular ideas about the building trades and construction work, with special reference to construction sites, hiring practices, and worker reactions to work conditions. Questions the extent of craft autonomy and attempts to explain how relations in the labor process foster both progressive and reactionary orientations among building tradesmen. Discusses worker autonomy versus management control at the construction site and the relationships among trade unions, contractors, and employment. Suggests a strategy for overcoming market forces in labor relations and housing production. Silver is an Assistant Professor of Sociology at Hofstra University. Bibliography; name and subject indexes.

- TAYLOR, BENJAMIN J. AND WITNEY, FRED. *Labor relations law*. Fifth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1971 . . . 1983] 1987. Pp. xvii, 862. ISBN 0-13-519861-2. JEL 87-0604

Fifth edition [see JEL no. 83-0523 for annotation of the fourth edition] of a textbook on labor relations law is intended for undergraduate and graduate liberal arts and business schools and for union and business personnel with little legal background. Includes the new doctrines established by the National Labor Relations Board and the courts since the prior edition, concentrating on major developments rather than on all changes. Examines a group of controversial cases, including "red letter" ones. Changes also include a discussion of the federal courts' responses to comparable worth, and public sector organization and collective bargaining. The Taft-Hartley commentaries have been revised and updated. The Landrum-Griffin Act presentation has been expanded to include discussion of the use of labor consultants, as well as being

revised and updated. Taylor is at the University of Oklahoma, and Witney is at Indiana University. Bibliography; index of cases; general index.

#### 840 DEMOGRAPHIC ECONOMICS

BIANCHI, SUZANNE M. AND SPAIN, DAPHNE. *American women in transition. The Population of the United States in the 1980s: A Census Monograph Series.* New York: Russell Sage Foundation for the National Committee for Research on the 1980 Census, 1986. Pp. xxii, 286. \$32.50, cloth; \$14.95, paper. ISBN 0-87154-112-2, pbk. JEL 87-0605

Analysis of the characteristics and impact of the major demographic and social changes in the U.S. economy since World War II on the role and position of women. Reviews changes in marriage patterns, fertility, and household living arrangements. Traces the increasingly public roles of women by examining their educational attainment and its relationship to marriage and fertility, labor force participation and occupational composition, and the correlation among these factors and women's earnings. Examines the relation between living arrangements, income, and poverty and between fertility and work force participation. Assesses the success of women at balancing their private and public roles. Bianchi is a demographer at the Center for Demographic Studies, U.S. Bureau of the Census. Spain is Assistant Professor of Sociology and of Urban and Environmental Planning at the University of Virginia. Bibliography, index.

KEOGH, GARY AND WHELAN, BRENDAN J. *A statistical analysis of the Irish electoral register and its use for population estimation and sample surveys.* Dublin: Economic and Social Research Institute, 1986. Pp. 126. Ire £ 6.50, paper. ISBN 0-7070-0083-1. JEL 87-0606

Analysis of the accuracy of the Irish electoral register and the extent to which inaccuracies in the register affect the results of research based upon it. Examines the entry and exit pattern of the register and investigates its correspondence to trends in the population. Creates a data set for the construction of independent variables to be employed for regression analysis using time-series data. Conducts population estimates on the basis of this data set. Investigates the effectiveness of the electoral register as a sampling frame, identifies biases, and presents some recommendations regarding the use of the register for electoral purposes. Keogh is an Assistant Research Officer and Whelan is a Research Professor at the Economic and Social Research Institute, Dublin. No index.

POZO, SUSAN, ed. *Essays on legal and illegal immigration: Papers presented in a seminar series conducted by the Department of Economics at Western Michigan University.* Kalamazoo, Mich.: W. E. Upjohn Institute for Employment Research, 1986. Pp. v, 128. \$13.95, cloth; \$8.95, paper. ISBN 0-88099-040-6, pbk. JEL 87-0607

Seven papers, originally presented as public lectures during 1984-85, discuss and analyze many of the issues debated during the passage of the recent federal immigration reform measure. Describes various approaches for handling the issue of illegal immigration, ranging from those that increase the cost of such migration to stricter enforcement of entry. The introductory essay discusses the multifaceted nature of the immigration debate. Other topics include control of international migration, the need for immigration reform, the illegal alien policy dilemma, the effects on the U.S. labor market, and the effects on U.S. taxpayers. The final essay discusses the desirable policy objectives and suitable policy instruments to achieve them. Contributors are: the editor, George J. Borjas, Michael J. Piore, Vernon M. Briggs Jr., Barry R. Chiswick, Francine D. Blau, and Jagdish N. Bhagwati. Pozo is at Western Michigan University. No index.

#### 900 Welfare Economics; I.

##### 910 WELFARE

ABEGAZ, BERHANU. *Studies of mass poverty. Studies in mass poverty series, no. 29.* Williamsburg, Va.: Ham and Mary, Department of Anthropology, 1986. Pp. xiv, 142. Paper. JEL 87-0608

Four papers examine the demographic characteristics of mass poverty in societies experiencing economic development. Berhanu Abegaz examines the theoretical issues in the measurement of poverty, the relationship between income distribution and demographic processes, and the extent of international and regional inequality and poverty. M. Khan analyzes the relationship between rural poverty and demographic behavior in Bangladesh. C. Isiugo-Abanihe discusses the linkage between child fostering and fertility in West Africa. C. H. Wood and S. D. McCracken review the nature of underdevelopment, urbanization, and collective social action in São Paulo. The contributors are economists and social scientists. Abegaz is Assistant

Professor of Economics at the College of William and Mary. No index.

AIKEN, LINDA H. AND MECHANIC, DAVID, eds. *Applications of social science to clinical medicine and health policy*. New Brunswick, N.J.: Rutgers University Press, 1986. Pp. ix, 588. Paper. ISBN 0-8135-1149-6. JEL 87-0609

Twenty-four papers selected to assess the relevance, application, and contribution of various areas of social science and health services research for health policy and clinical care in the United States. Part 1 examines the social contexts of health care and policy such as the interplay between values, science, technology and social structure, the effect of social stratification on health, and the changing health care system. Part 2 focuses on significant research contributions relating to: the prevention and treatment of major causes of cardiovascular disease, cancer, and mental illness; the assessment of health status; and social experiments in health. Papers in part 3 consider health and illness over the life cycle. The papers in part 4 discuss prevention, caring, and social processes affecting vulnerability to illness and the outcomes of patient-practitioner relationships. Part 5 addresses the organization, financing, and provision of health care services. Aiken is Vice-President, Robert Wood Johnson Foundation, Princeton, New Jersey. Mechanic is René Dubos Professor of Behavioral Sciences, Rutgers University. Index.

BAGBY, NANCY S. AND SULLIVAN, SEAN. *Buying smart: Business strategies for managing health care costs*. AEI Studies series, no. 444. Washington, D.C.: American Enterprise Institute for Public Policy Research, 1986. Pp. xi, 66. Paper. ISBN 0-8447-3604-X. JEL 87-0610

Analysis of attempts by private employers and business coalitions to check increases in health care costs. Discusses the nature of initiatives by the Midwest Business Group on Health, private-sector attempts to increase competition in the provision of health care in Iowa, and the nature of cost management strategies by Honeywell Inc. and Control Data Corporation. Bagby is a consultant to the American Enterprise Institute's Center for Health Policy Research. Sullivan is a Senior Associate at the American Enterprise Institute's Center for Health Policy Studies. No index.

BERGMANN, BARBARA R. *The economic emergence of women*. New York: Basic Books, 1986. Pp. x, 372. \$19.95. ISBN 0-465-01796-7. JEL 87-0611

Explores the origins and consequences of the changing role of women from that of housewives to wage earners. Discusses the breakup of the "sex role caste system," focusing on women's place in

the labor market, the future of the two-parent family, and the changes in male lives. Describes the economic impetus behind the emergence of working women; the influence of social factors—births, schools, divorces, and ideas; the place of women in the labor market; sex segregation on the job as the root of women's disadvantage; why female wages are low; fighting discrimination through affirmative action; achieving pay equity; the job of a housewife; poverty and single parents; the economics and politics of keeping house and family care; and child care. Presents some international comparisons of the status of women in paid employment. Concludes with a policy agenda to address the sex role revolution. Bergmann is a Professor of Economics at the University of Maryland. Bibliography, index.

BERNSTEIN, BLANCHIE. *Saving a generation*. Twentieth Century Fund Paper series. New York: Priority Press, 1986. Pp. vi, 63. \$7.50. paper. ISBN 0-87074-206-1. JEL 87-0612

Analysis of the demography of poverty. Focuses on female-headed families and examines the possible benefits of economic measures to reduce poverty. Discusses recent changes in social behavior such as teenage pregnancy, school and college dropouts and family stability. Investigates the probable impact of welfare reform and the feasibility of various solutions to the problem. Contends that intervention aimed at changing social behavior is necessary to counteract further breakdown in the structure of the family and its associated problems. No index.

BUTLER, JAMES R. G. AND DOESSEL, DARREL P., eds. *Economics and health 1985: Proceedings of the Seventh Australian Conference of Health Economists*. Australian Studies in Health Service Administration series, no. 56. Kensington, New South Wales: University of New South Wales, School of Health Administration, 1986. Pp. iv, 249. Paper. ISBN 085832-053-3. JEL 87-0613

Nine essays and discussions consider the following topics: (1) a policy perspective on unemployment and health in Australia; (2) a comparison of the resource need index and information theory measures for analyzing hospital case mix standardization; (3) the implications of the New South Wales doctors' dispute; (4) a longitudinal study of health changes following the introduction of Medicare in Western Sydney; (5) a contingency approach to the design and use of budgeting in a public teaching hospital; (6) a comparative cost analysis of terminal cancer care; (7) hospital output and the use of diagnosis-related groups for purposes of economic and financial analysis; (8) the allocation of

hospital costs to the type of case; and (9) the economics of reducing hypertension through reduction in sodium intake. Butler is with the Department of Marketing and Applied Economics at Brisbane College of Advanced Education. Doessel is with the Department of Economics, University of Queensland. No index.

DIIN, ELCHIANAN, ed. *Federal block grants to education*. Oxford; New York; Toronto and Sydney: Pergamon Press, 1986. Pp. vii, 163-277. \$19.50. ISBN 0-08-032691-9. JEL 87-0614

Eleven papers discuss the theory and implementation of federal education block grants. Part 1 describes the act and the debate surrounding its legislation. Part 2 presents case studies of its implementation in Colorado, Michigan, Nebraska, Pennsylvania, South Carolina, Tennessee, Texas, and Washington. Part 3 presents alternative views of the merits of block grants to education. The contributors are mainly economists and education specialists. Colin is Professor of Economics at the University of South Carolina. Index.

EWEEs, DONALD N. *Controlling asbestos in buildings: An economic investigation*. RFF Study series. Washington, D.C.: Resources for the Future, distributed by Johns Hopkins University Press, Baltimore, Md., 1986. Pp. v, 106. \$9.95, paper. ISBN 0-915707-27-6. JEL 87-0615

Addresses the differences between owners and tenants over what to do about asbestos currently in buildings. Study focuses on the economic implications of choosing different times to remove the asbestos—removing it at once, controlling it in some other way, or leaving it to be removed at renovation or demolition of the structure. Develops a methodology for economic analysis of asbestos control programs in existing buildings and presents the results of three case studies. Finds that, if the asbestos materials are in good condition and undisturbed, the risks to health of building occupants is low and do not justify the costs involved in immediate removal. Dewees is a Professor of Economics and Law at the University of Toronto. No index.

GREEN, DAVID G. *Challenge to the NHS. A study of competition in American health care and the lessons for Britain*. Hobart Paperback series, no. 23. London: Institute of Economic Affairs, distributed in North America by Transatlantic Arts, Albuquerque, New Mexico, 1986. Pp. xv, 116. \$14.95, paper. ISBN 0-255-36194-7. JEL 87-0616

Examines whether a competitive market in health would make an attractive alternative to the British National Health System. Reports on re-

search in the area of recent developments in the health-care market in the United States, especially changes in the organization and finance of services provided by doctors, hospitals, and insurance companies. Argues that the principal failings of American medical care have not been the result of competitive markets, but the doctors' "professional closed shop," which restricted entry of medical students, but is now breaking down. Traces the U.S. history, including the rise of monopoly, control over hospitals, antitrust action, the emergence of competition, and the impact on the poor. Recommends reform in the U.K. with three principles—the poor should be protected by the government expenditure for health care should be a private decision, and the government should promote competition by ending the NHS monopoly. Green is a Research Fellow at the Institute of Economic Affairs, London. Bibliography, glossary, no index.

GREER, JOEL AND THORBECKE, ERIK. *Food poverty and consumption patterns in Kenya*. Geneva: International Labour Office, 1986. Pp. xii, 170. Sw Fr 20.00, paper. ISBN 92-2-105374-1. JEL 87-0617

Analysis of the relationship between changes in the relative price of food and the incidence of poverty in Kenya. Evaluates alternative measures of poverty and defines the concept of food poverty. Examines food consumption patterns and estimates the incidence of food poverty among smallholders in different provinces in Kenya. Identifies determinants of food consumption and the impact of relative food consumption, and on general guidelines for the adverse effects of food. Greer is in the Department of Economics and Thorbecke is in the Department of Economics and Food Science, University of Nairobi. No index.

HELLER, PETER S., HEIMING, RICHARD AND KOURNELL, PETER W. *Aging and social expenditure in the major industrial countries, 1980-2025*. Occasional Papers series, no. 47. Washington, D. C.: International Monetary Fund, 1986. Pp. viii, 76. \$7.50, paper. ISBN 0-939934-68-X. JEL 87-0618

Examines the impact of prospective demographic trends and other factors on the level and structure of social expenditure by the governments of the seven major industrial countries (Canada, France, West Germany, Italy, Japan, the United Kingdom, and the United States) through the year 2025. Also reviews key policy issues likely to emerge, both at an aggregate and a sectoral level.

and types of policies countries have initiated in trying to cope with the demographic trends. Presents the results of the projections for major social expenditure programs and their key policy issues. Sectoral chapters also indicate types of policy actions introduced by different countries to stem the likely growth in expenditure. Reflects data available prior to June 1985. A general conclusion is that there will be a need for additional policy measures to contain the real increase in per capita benefits, especially in those countries with high tax rates. The authors are in the Fiscal Affairs Department, International Monetary Fund. No index.

PETERSON, PAUL E.; RABE, BARRY G. AND WONG, KENNETH K. *When federalism works*. Washington, D.C.: Brookings Institution, 1986. Pp. xvi, 245. \$28.95, cloth; \$10.95, paper. ISBN 0-8157-7020-0.

JEL 87-0619

Explores the conventional wisdom on federal grants by examining the operations of nine federal programs in health care, education, and housing. Reviews these programs in four cities and concludes that they operated more effectively than originally believed possible. Emphasizes the importance of competent managerial professionals and avoidance of local political conflicts. Begins with an examination of the rapid development of the federal system of intergovernmental grants since World War II. Discusses theories of federal programs such as supportive and redistributive goals. Cites examples and proposes answers concerned with why some programs have worked well and others have had little success. Proposes reforms to make the federal grants-in-aid programs more effective, especially for disadvantaged groups and others requiring special needs. Peterson is Director of the Governmental Studies program at the Brookings Institution. Rabe is an Assistant Professor of Health Politics, University of Michigan. Wong is Assistant Professor of Political Science, University of Oregon. Index.

PSACHARPOULOS, GEORGE; TAN, JEE-PENG AND JIMENEZ, EMMANUEL. *Financing education in developing countries: An exploration of policy options*. Washington, D.C.: World Bank, 1986. Pp. iv, 67. Paper. ISBN 0-8213-0777-0.

JEL 87-0620

Presents policy options to remedy problems in education, perceived as underinvestment, misallocation of resources across levels of schooling, inefficiencies within schools, and social inequalities in developing countries. The options considered are: selective user charges and reallocation of public spending among levels of schooling, selective scholarships and development of a credit market for student loans, and decentralization of the man-

agement of public education and encouragement of the expansion of private and community-supported schools. Analyzes the effects of such a policy package and discusses its implementation. About a third of the book consists of an appendix of statistics on education in developing countries. The authors are in the Research Division, Education and Training Department, World Bank, Washington, D.C. Bibliography; no index.

ROSE, RICHARD AND SHIRATORI, REI, eds. *The welfare state: East and West*. Oxford; New York; Toronto and Melbourne: Oxford University Press, 1986. Pp. 213. \$29.95. ISBN 0-19-503956-4.

JEL 87-0621

Nine essays examine the welfare state and consider how the provision of welfare differs in societies that are similar in their high standards of material wealth—the United States, Japan, Britain, Scandinavia, West Germany, and Israel. Richard Rose examines the state's contribution to total welfare in society. Nathan Glazer describes features of social policy in the United States. Naomi Maruo deals with the development of the welfare mix in Japan. Rose discusses the dynamics of social policy in Britain. Erik Allardt discusses the civic conception of the welfare state in Scandinavia. Wolfgang Zapf looks at the development and structure of the West German welfare system. Shmuel Eisenstadt examines welfare in Israel. Yukio Noguchi discusses the Japanese experience with pensions. Rei Shiratori considers the future of the welfare state. Rose is Director of the Centre for the Study of Public Policy at the University of Strathclyde, Glasgow. Shiratori is Professor of Government at the University of Essex and at Dokkyo University, Japan. Index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *Activities for the advancement of women: Equality, development and peace. Report of Jean Feraud-Laurent, Special Rapporteur on the suppression of the traffic in persons and the exploitation of the prostitution of others*. New York: United Nations, 1985. Pp. 69. \$10.50, paper. ISBN 92-1-130107-6.

JEL 87-0622

Synthesis of surveys and studies, including those done by the U.N. and other organizations since 1949, on the traffic in persons and exploitation of the prostitution of women and children. Describes the world of prostitution and slavery to which women and children are subjected as well as its international networks. Examines some national policies and offers suggestions for national policy and international cooperation to U.N. member states. Proposes a program of action aimed at pre-

venting prostitution, rehabilitating those engaged in prostitution, repressing the traffic in persons, preventing and treating venereal disease, and organizing global programs. Annexes contain supporting U.N. documentation and other documentation and report. Also available in French, Russian, and Spanish. Bibliography; no index.

## 920 CONSUMER ECONOMICS

CAPPS, ORAL, JR. AND SENAUER, BENJAMIN, eds. *Food demand analysis: Implications for future consumption*. Blacksburg: Virginia Polytechnic Institute and State University, Department of Agricultural Economics, 1986. Pp. xii, 292. Paper.

JEL 87-0623

Fourteen papers deal with analysis of demand for food, emphasizing the implications for future consumption; sponsored by Southern Regional Research Project S-165 and the Farm Foundation. Papers discuss topics such as market demand systems, the implications for demand projections of the global behavior of demand elasticities for food, U.S. household food expenditure patterns, aggregate food expenditure projections, factors affecting food consumption, the structure of the demand for food, and demographic factors affecting food consumption. Papers also discuss the demand for particular food groups and commodities, such as beef, citrus juices, and convenience foods and non-convenience foods, emphasizing demand specifications, model development, and empirical results, and examine specific demand analysis issues, significant from both a methodological and empirical perspective. The contributors are mainly economists. Capps is in the Department of Agricultural Economics at Texas A&M. Senauer is in the Department of Agriculture and Applied Economics at the University of Minnesota. Index.

EARL, PETER. *Lifestyle economics: Consumer behavior in a turbulent world*. New York: St. Martin's Press, 1986. Pp. xiii, 314. \$29.95. ISBN 0-312-48585-9.

JEL 87-0624

Outline of behavioral economics—an analysis of the economics of consumer behavior. Discusses the relationship between various segments of orthodox economics and the economics of consumer behavior. Explores similarities between the behavior of households and firms. Employs personal construct theory to focus on turbulence and strategic aspects of choice and analyzes the formation and evolution of expectations. Examines the process

of choice in the context of complexity and uncertainty. Discusses noncompensatory choices in retrospect and prospect and the nature of choice rules and the competitive process. Earl is Lecturer in Economics at the University of Tasmania. Bibliography; index.

HEWLETT, SYLVIA ANN; ICHIMAN, ALICE S. AND SWEENEY, JOHN J., eds. *Family and work: Bridging the gap*. Cambridge, Mass.: Harper and Row, Balinger, 1986. Pp. xiv, 218. \$29.95. ISBN 0-88730-066-9.

JEL 87-0625

Eighteen essays address the problems associated with the changing economic and social environment that has witnessed a transformation in the relationships between the workplace and the traditional family structure. Essays are based on a project and conference sponsored by the Economic Policy Council (EPC) of the United Nations Association of the United States. Expands on an earlier publication, *Work and Family in the United States: A Policy Initiative*, (1985). Papers cover a broad range of topics, among them: government and family policy; the role of collective bargaining in the determination of family policy, the origins, progress, and future of the Swedish family policy, child care in France, a description of the status of child care, how the United States compares in maternity, paternity, and parenting policies, early childhood education and the public schools, the ethics of a public preschool, federal child and family programs; why progress has been slow; benefits and assistance; earnings differentials; lessons for the U.S.; family issues for parents, and the U.S. woman. The conference agenda for the U.S. was set by mainly social scientists, labor officials, union officials, and specialists. Hewlett is Vice President for Economic Studies at the United Nations Association of the United States, Ichiman is President of Sarah Lawrence College, and Sweeney is President of the Service Employees International Union. Index.

IPPOLITO, PAULINE M. AND SCHEFFMAN, DAVID T., eds. *Empirical approaches to consumer protection economics. Proceedings of a conference sponsored by the Bureau of Economics, Federal Trade Commission, April 26-27, 1984*. Washington, D.C.: Federal Trade Commission, 1986. Pp. ii, 484. Paper.

JEL 87-0626

Thirteen papers, plus comments and opening remarks, presented at a Federal Trade Commission Conference, which had two goals: (1) highlighting

the paucity of empirical research examining consumer information and theories and (2) bringing together economists with varied interests in policy and the economics of information. An introductory paper reviews the status of economics of information literature relating to consumer protection issues such as liability rules, deception, minimum quality standards, and fraud. The volume is organized in four sections: quality issues, advertising, experimental studies, and econometric studies. Specific papers deal with housing quality, warranty provisions on used cars, advertising and consumer learning, quality uncertainty, warranty coverage and dispute resolution, product recalls, consumer shopping behavior in the retail coffee market, and government policy and the cigarette industry. Ippolito is Assistant Director for Industry Analysis, Bureau of Economics, Federal Trade Commission. Scheffman is Acting Director and Deputy Director for Competition and Antitrust of the same agency. No index.

TAYLOR, JEFFREY R. AND HARDEE, KAREN A. *Consumer demand in China: A statistical factbook*. Westview Special Studies on China. Boulder and London: Westview Press, 1986. Pp. xxii, 187. Paper. ISBN 0-8133-7310-7. JEL 87-0627

A factbook about the nature and characteristics of consumer demand in China. Part 1 presents an overview of income and consumption patterns. Provides information regarding urban-rural and provincial patterns of income and expenditure as well as a detailed consumer profile. Part 2 contains statistical tables providing national and provincial data on income and wages, expenditure disaggregated into general categories, consumption of individual commodities, retail sales, ownership of durable goods, and housing as well as data on price indexes and exchange rates. The authors are associated with the U.S. Bureau of the Census. Bibliography; no index.

### 930 URBAN ECONOMICS

TAYLOR, RALPH B., ed. *Urban neighborhoods: Research and policy*. New York and London: Praeger, 1986. Pp. xiv, 376. \$35.00. ISBN 0-275-92017-8. JEL 87-0628

Eleven essays explore the relationship between neighborhood research and policy. Two papers consider the accomplishments and the limitations of neighborhood planning in the United States, and the promise and reality of neighborhood-based participation in the planning process. One paper examines informal social control and crime prevention in modern urban neighborhoods. Two papers

explore issues pertaining to neighborhood economics: housing prices and neighborhood characteristics, and the role of the small commercial center in the urban neighborhood. Three papers are case studies of neighborhood improvement projects; they focus on the appropriate roles of the planner and community in small-scale improvement and development efforts, roles for research and the researcher in neighborhood development, and intervention to enable neighborhood mobilization. Three studies consider neighborhood fabric and viability; they discuss the use of research to build stronger neighborhoods, some empirical patterns of the helping roles of neighbors, and the psychosocial significance of the neighborhood in metropolitan life. Contributors are mainly urban planning specialists, social scientists, and psychologists. Taylor is Associate Professor, Department of Criminal Justice, Temple University. Index.

UNITED NATIONS, ECONOMIC COMMISSION FOR EUROPE. *Human settlements situation in the ECE region around 1980. Survey prepared by the secretariat under the auspices of the Committee on Housing, Building and Planning*. New York: United Nations, 1986. Pp. iv, 71. \$12.50, paper. ISBN 92-1-116343-9. JEL 87-0629

A description of the changes in human settlements in Economic Commission for Europe (ECE) countries. Reviews the basic conditions underlying settlement development in market-economy countries and in centrally planned economies. Describes the process of development of settlement and of physical planning in individual countries as well as regional subgroups. Compares the development of housing and related infrastructure and services and in the construction and building material industries. No index.

### 940 REGIONAL ECONOMICS

BEEMILLER, RICHARD M.; AMBARGIS, ZOE O. AND FRIEDENBERG, HOWARD L. *Regional multipliers: A user handbook for the Regional Input-Output Modeling System (RIMS II)*. Washington, D.C.: U.S. Department of Commerce, Bureau of Economic Analysis, 1986. Pp. iv, 131. Paper. JEL 87-0630

A handbook of regional output, earnings, and employment multipliers derived from the Regional Input-Output Modeling System (RIMS II). Describes informational requirements of this system and presents case studies to illustrate its uses. Contains a RIMS II reading list and details of regional multipliers. No index.

WALZER, NORMAN AND CHICCHINE, DAVID L., eds. *Financing economic development in the 1990s: Issues and trends*. New York and London: Greenwood

Press, Praeger, 1986. Pp. xxvii, 233. \$38.95. ISBN 0-275-92128-X. JEL 87-0631

Thirteen papers analyze the role of local governments in the promotion of economic development in the Midwest. Topics include: population trends in the Midwest; trends in business employment; the effect of business climate on employment growth; state practices for attracting high-tech industry and jobs; criteria used for facility-location selection; the role of the state in economic development; cost-effective development finance; the role of small business in economic development; capital markets for public borrowers; the impact of the President's tax proposal on local and state government capital financing; the U.S. trade deficit and international competitiveness; fiscal federalism; and private-sector economic development activities in the Chicago metropolitan area. The contributors are mainly economists. Walzer is Professor of Economics at Western Illinois University. Cluicoin is Associate Professor of Agricultural Economics at the University of Illinois, Urbana. Index.

#### RELATED DISCIPLINES

GOUREVITZ II, PETER. *Politics in hard times. Comparative responses to international economic crises.* Cornell Studies in Political Economy series. Ithaca and London: Cornell University Press, 1986. Pp. 267. \$27.50, cloth, \$12.95, paper. ISBN 0-8014-9436-2, pbk. JEL 87-0632

A comparative analysis of the response of the United States, the United Kingdom, France, Germany, and Sweden to crises in the international economy. Examines the policy responses of these countries as well as the changing pattern of alliances among societal actors in response to the long deflation at the end of the nineteenth century, the Great Depression, and the extreme instability of the 1970s and 1980s. Argues that the crises led to the development and realignment of coalitions among various economic actors and that differences in policy response arose from differences in the institutions that mediated the mobilization and application of power. Traces the changing coalitions over time and reviews alternative explanations of their content. The author is Professor of Political Science at the University of California, San Diego. Index.

HAWLEY, AMOS H. *Human ecology. A theoretical essay.* Chicago and London: University of Chicago Press, 1986. Pp. viii, 168. \$26.00, cloth, \$9.95, paper. ISBN 0-226-31984-9, pbk. JEL 87-0633

Presents an approach toward a unified theory of human ecology. Discusses environment, popula-

tion, and ecosystem as the basic components of ecological analysis. Explores the concept of ecosystem change and analyzes the process of cumulative change through growth and evolution of the ecosystem and through expansion in time and space. Discusses the limits to cumulative change and the relevance of human ecology for social policy. Hawley is Kenan Professor Emeritus in Sociology at the University of North Carolina, Chapel Hill. Index.

KEATINGE, MICHAEL AND HAINSWORTH, PAUL. *Decentralisation and change in contemporary France.* Aldershot, England, and Brookfield, VT.: Gower, 1986. Pp. 143. \$38.00. ISBN 0-566-05206-7. JEL 87-0634

Analysis of the attempt at the decentralization of power promoted by the French Socialists and presided over by François Mitterrand. Reviews alternative interpretations of the structure of French territorial government. Presents a historical view of France as undergoing increased state centralization and outlines the debate regarding the relationship between the state and its citizens. Examines the reform attempts of previous French governments. Traces the growth of regionalism and micronationalism as a background to the Socialist impulse toward decentralization. Discusses the legislation and implementation of decentralization since 1981 and its relationship with the formulation and exercise of economic policy. Presents a preliminary assessment of the impact of decentralization on power relations. Keatinge is Lecturer in Politics at the University of Ulster. Bibliography.

KLITGAARD, ROBERT. *Selection processes in developing countries.* Hopkins Studies in Education series. Baltimore and London: Johns Hopkins University Press, 1986. Pp. vi, 191. \$24.95. ISBN 0-8018-3269-1. JEL 87-0635

Reviews the history of selection processes for choosing educational and administrative elites in the People's Republic of China. Examines the nature, efficiency, and impact of different selection policies in developing countries. Outlines approaches to defining the objectives of selection and to measuring and assessing the efficiency of selection. Discusses problems of bias and underrepresentation in group selection and analyzes the nature of incentives created by selection processes. Presents a case study of the characteristics and effects of the academic selection process in Indonesia. Klitgaard is Associate Professor of Public Policy in the John F. Kennedy School of Government, Harvard University. Index.

KLUEGEL, JAMES R. AND SMITH, ELIOT R. *Beliefs about inequality: Americans' views of what is and what ought to be*. Social Institutions and Social Change series. New York: Aldine de Gruyter, 1986. Pp. x, 332. \$37.95, cloth; \$16.95, paper. ISBN 0-202-30326-8. JEL 87-0636

Reports the results of a national survey concerned with beliefs about social and economic inequality, indicating the structure, determinants, and certain political and personal consequences of these beliefs. Surveys were conducted in the summer and fall of 1980 and covered 2,212 Americans over age eighteen. Examines the basic dominant beliefs of Americans, specifically dealing with opportunity, reasons for poverty and wealth, and distributive justice. Discusses popular beliefs and attitudes directly related to public policy on inequality, examining redistributive policies, attitudes toward affirmative action, discrimination, and equal rights. Concludes that most Americans do not believe that all is well with the workings of stratification and that many question the fairness of their personal opportunity and economic status. Kluegel is Chairman of the Department of Sociology at the University of Illinois. Smith is an Associate Professor of Psychological Sciences at Purdue University. Bibliography, index.

LA SALLE, J. P. *The stability and control of discrete processes*. Applied Mathematical Science series, no. 62. New York; Berlin; London and Tokyo: Springer, 1986. Pp. 150. \$22.00, paper. ISBN 0-387-96411-8. JEL 87-0637

Discusses the stability and controllability of a discrete dynamical system. Considers: Liapunov's direct method, linear systems, computational criteria of stable matrices, stability by the linear approximation, the Jordan Canonical Form, higher order equations, companion matrices, algorithms for computing  $A^n$ , variation of parameters and undetermined coefficients in nonhomogeneous linear systems, forced oscillations, systems of higher order equations, control of linear systems, stabilization by linear feedback, minimum energy control and minimum time-energy feedback control, observability, observers, state estimation, and stabilization by dynamic feedback. Sections contain exercises, theorems, propositions, proofs, and examples. Index.

NEVITTE, NEIL AND KENNEDY, CHARLES H., eds. *Ethnic preference and public policy in developing states*. Boulder, Colo.: Rienner, 1986. Pp. ix, 203. \$25.00. ISBN 0-931477-89-1. JEL 87-0638

Seven papers presented at a panel organized for the annual meeting of the American Political Science Association in Washington, D.C., in September

1984. Papers examine how policies of ethnic preference work to affect communal conflict in developing states and consider the origins, implementation, and consequences of such policies in Africa, Pakistan, Malaysia, Sri Lanka, and Guyana. Two recurrent themes, according to the editors, are the significance of the bureaucracy and of post-secondary education as the institutional sites of preferential policy battles and the relationship between the colonial experience and postcolonial policies of ethnic preference. Contributors are Donald Rothchild, Gordon P. Means, R. S. Milne, Robert Oberst, Ralph R. Premdas, and the editors. Nevitte is Associate Professor of Political Science, University of Calgary. Kennedy is Assistant Professor of Politics, Wake Forest University. Index.

SCOTT, W. RICHARD. *Organizations: Rational, natural and open systems*. Second edition. Englewood Cliffs, N.J.: Prentice-Hall, [1981] 1987. Pp. xvii, 377. ISBN 0-13-641820-1. JEL 87-0639

Surveys and evaluates the rapidly developing sociological approach to organizations. The first part is an introduction to organizations and examines the practical and theoretical benefits derived from a better understanding of the subject. Part 2 examines organizations as rational, natural, and open systems in detail and ends with an attempt at integrating the perspectives. Part 3 deals with the ways in which organizations relate to their environments and the determinants of organizational structure. Raises the question of why organizations exist and how they are created. Also describes sources of structural complexity. The last part examines organizations and their relationships with society, emphasizing problems associated with their operation and growth. Scott is Professor of Sociology at Stanford University. Name and subject indexes.

TANNER, DANIEL AND TANNER, LAUREL. *Supervision in Education: Problems and practices*. New York: Macmillan, London: Collier Macmillan, 1987. Pp. xvii, 565. \$24.00. ISBN 0-02-418950-2. JEL 87-0640

Textbook focusing on educational supervision as a problem-solving process. The first part describes the emerging field of educational supervision, emphasizing its evolution and professionalization trend. Part 2 is concerned with the framework and functions of educational supervision, focusing on the administrative organization of supervision and supervisory roles. The next part examines the theory and practice of educational supervision, particularly the ecology of the school, the climate for supervision, models of supervision, supervision and teacher effectiveness, and common classroom problems. Part 4 examines the forces and sources

Published quarterly in English by the Korea International Economic Association. The Spring 1987 issue (Vol. 1, no. 1) contains eight articles, a political-economy-theoretic analysis of voluntary export restrictions, *quid pro quo* direct foreign investment, and voluntary import expansions, the protective effects of discriminatory quantitative restrictions, a case study of South Korea, focusing on concentration and earnings, price and inventory dynamics of primary commodities, aggregation and the endogeneity problem, market structure, competition, and welfare change due to technological innovations, intra-industry trade in the Pacific Basin; and an empirical analysis of the developing

countries' case regarding real exchange rate variability. Annual subscription: individuals, nonmembers \$30.00; members \$15.00; institutions, \$40.00. Write to: Professor Wontack Hong, Department of International Economics, College of Social Sciences, Seoul University, Seoul 151, South Korea.

# *International Trade Journal*

Quarterly publication of the Institute of International Trade, Laredo State University, provides a forum for the scholarly exchange of research findings and significant conceptual or theoretical contributions to the field. The Fall 1986 issue (Vol. 1, no. 1) contains five articles on: exchange rates and foreign trade; bilateral trade flows, international joint ventures and the U.S. auto industry; determinants and consequences of across-the-board trade restrictions in the U.S. economy; and the choice of appropriate technology in a general equilibrium model. Also includes book reviews. Annual subscriptions: \$25.00, individuals, \$35.00, institutions; \$10.00, single issue. (Add \$6.00 outside North America.) Write to: *International Trade Journal*, Laredo State University, Laredo, Texas 78040. (ISSN 0885-0908)

# *Journal of Applied Business Research*

Published three times a year every fall, winter, and spring. The Fall 1986 issue (Vol. 4) contains twelve articles covering: accounting (dollar unit sampling, the rule of 78's, and implication of the relationship of budgeting and accounting for public policy); communications (the challenge of being politically effective); finance (prospective payments and medical costs, effect of the Tax Reform Act of 1986 on U.S. manufacturing corporations, the separability of real and financial decisions of a firm, and corporate motives in bond refunding and calling); economics (export behavior of domestic and transnational firms in Brazilian manufacturing and labor self-management's consistency with Rawls' ethical criteria); law (new dimensions in liability related to corporate insider trading); and marketing (interest rate variations for automobile loans in large cities). Annual subscription: \$20.00 for individuals; \$60.00 for institutions; add \$10.00 outside the United States and Canada. Write to: Professor Ronald C. Clute, University of Wyoming, College of Commerce and Industry, 3810 Reynolds, Laramie, Wyoming 82070.

# *Journal of Voluntary Action Research: Studies of Volunteering, Citizen Participation, Philanthropy, and Nonprofit Organizations*

Quarterly publication of the Association of Voluntary Action Scholars reports research on all as-

pects of voluntary action. The January-March 1986 issue (Vol. 15, no. 1) includes six articles as well as research notes and book reviews. Topics of articles include: the use of conflict management behaviors in voluntary organizations, understanding organizational commitment for volunteers, inter-organizational conflict, Mexican voluntary Associations, black participation in voluntary organizations, and leadership characteristics of 4-H leaders. For information write to: Association of Voluntary Action Scholars, S-211 Henderson Human Development Building, Pennsylvania State University, University Park, Pa. 16802. (ISSN 0094-0607)

# *Lecturas de Economía*

Published three times a year in Spanish by the Economics Department of the University of Antioquia, Medellín, Colombia. Purpose is to present papers on different topics in economics and general articles on the social sciences. The January-April 1986 issue (No. 19) contains articles on: Karl Marx, the financial problems of electricity shortages in Colombia; the transition of socialism in small open economies, the case of Nicaragua, urban modeling of Medellín, regionalism, the Keynesian-monetarist debate; the peasant economy; and recent developments in applied econometrics. Also contains a panel discussion on the general outlook and policy of the Colombian economy, as well as several book reviews. Includes English summaries. Annual subscription: Col\$1,500 for individuals and Col\$1,200 for students, in Colombia; \$30.00 in the United States. Write to: *Lecturas de Economía*, Facultad de Ciencias Económicas, Universidad De Antioquia, Apartado aéreo 1226, Medellín, Colombia. (ISSN 0120-0596)

# *Literatura Económica*

Publication of the Instituto de Planejamento Econômico e Social (IPEA); entirely in Portuguese. The annual subscription includes three regular issues published in February, June, and October, which present papers on different topics in economics as well as information on current research in Brazil, and six supplements that include abstracts of selected Brazilian and foreign economic journals. The February 1986 issue (Vol. 8, no. 1) includes translations of two articles written by James Tobin. Shorter papers discuss the contributions of Richard Stone to economics and of Ignácio M. Rangel to Brazilian economic thought. No English summaries. Annual subscription: Cz\$50.00. Write to: IPEA—Serviço Editorial, Av. Pres. Antônio Carlos, 51/ 13, andar, Caixa Postal 2672, 20 020, Rio de Janeiro, Brazil.

***Maandschrift Economie: Tijdschrift voor Algemeen-en Sociaal-economische Vraagstukken***

Issued six times a year, this Dutch-language journal has been published for over 50 years. Volume 50, no. 2 (1987) contains five articles, an editorial comment, and book reviews. Articles refer to: government popularity functions (L. P. M. Peepers and T. B. M. Steenkamp), the Stabex system (L. Berlage and J. Schockaert), earnings differentials among men and women in the Netherlands (J. J. Schippers and J. J. Siegers), trade modeling (S. Brakman), and discouraged workers and additional workers effects (W. J. M. L. Wong Meeuw Hing). No English summaries. Annual subscriptions: Dfl 90.00, single issues, Dfl 19.50, students, 20 percent discount. Write to: Maandschrift Economie, Libresso bv, postbus 23, 7400 GA. Deventer, the Netherlands. (ISSN 0013-0486)

***North Central Journal of Agricultural Economics***

Semi-annual publication sponsored by the North Central Committee (NCA-12), which is comprised of heads of departments of agricultural economics of the land grant universities in thirteen states. Its purpose is to communicate information about empirical work in agricultural economics to professionals engaged in agricultural extension, teaching, and research. Emphasis is on the north central region of the United States. The July 1986 issue (Vol. 8, no. 2) contains twelve articles. Topics include: projecting adoption rates of new biotechnology products, the market for agricultural economists, cash versus accrual measures of farm income, basic economics of an export bonus scheme, the interyear effect of routine marketing on farm income and utility, the effect of farm financial stress on off-farm work behavior, a structural analysis of farm machinery demand in the United States, management strategies for controlling the soybean cyst nematode, price impacts associated with the closing of hog slaughtering plants, and soil management decisions. Annual subscription: \$10.00 for each volume, add \$4.00 per volume outside the U.S., make checks payable to: Purdue

University. Write to: Dr. Lee F. Schrader, Editor, NCJAE, Department of Agricultural Economics, Purdue University, West Lafayette, Indiana 47907.

***Quaderni Sardi di Economia***

Published four times a year by the Bank of Sardinia. The first issue of 1986 (Vol. 16, no. 1) contains four articles. Topics are: reform of the 1936 Italian banking law versus adjustment of banking legislation, the theory of effective protection and its empirical relevance for the Italian industrial system; the question of whether the designation of Sardinia as a Free Port Zone will result in reduced regional unemployment and economic growth, and the development of a regional policy of agricultural structures. All articles are in Italian, with English summaries. Also includes several book reviews. For information, write to: Bank of Sardinia, viale Umberto 36, 07100 Sassari, Sardinia. (ISSN 0391-8394)

***Revista Latinoamericana de Historia Económica y Social. Historia y Economía en América Latina***

Semiannual publication (in Spanish) of the Centro Latinoamericano de Historia Económica y Social, Lima, Peru. Contains papers analyzing Latin American economic and social history. Issue no. 5 (1st semester, 1985) contains four articles on rural labor markets in Peru, the state of the art of economic thought in Latin America, the evolution of scientific research and the living standards, and the turn of the century. Issue no. 4 (2nd semester, 1984) contains research on petty commodity economic history. No English summaries. Annual subscription: \$30.00 (institutional rates). Write to: Centro Latinoamericano de Historia Económica y Social, Apartado Postal 31058, Administración Postal Ingeniería, Lima 31, Peru.

**Editor's Note**

The following persons assisted the editors in annotating these books: Mrs. Joan Daley, Mrs. Aurelia Hooley, and Mrs. Vibha Kapuria-Foreman and Professor Reuben E. Slesinger (both of the University of Pittsburgh).

The articles appearing in the Subject Index were classified under the direction of Professor Asatoshi Maeshiro, Editorial Consultant, assisted by Mr. A'amer Farooqi, Mr. Nayer Hussain, Mr. Edgar L. Zamalloa, and Mrs. Lorena M. Zamalloa (all of the University of Pittsburgh).
